herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2307 precursor RNA is designated SEQ ID:2293, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2293 is located at position 122989 relative to the genome of lumpy skin disease virus.

[32257] VGAM2307 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32258] An enzyme complex designated DICER COMPLEX, dices the VGAM2307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2307 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2307 RNA is designated SEQ ID:5018, and is provided hereinbelow with reference to the sequence listing part.

[32259] VGAM2307 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32260] VGAM2307 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2307 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32261] The complementary binding of VGAM2307 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2307 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[32262] It is appreciated that VGAM2307 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2307 host target genes. The mRNA of each one of this plurality of VGAM2307 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2307 RNA, herein designated VGAM RNA, and which when bound by VGAM2307 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2307 host target proteins.

[32263] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2307 gene, herein designated VGAM GENE, on one or more VGAM2307 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32264] It is yet further appreciated that a function of VGAM2307 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2307 correlate with, and may be deduced from, the identity of the host target genes which VGAM2307 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32265] Nucleotide sequences of the VGAM2307 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2307 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2307 are further described hereinbelow with reference to Table 1.

[32266] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2307 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32267] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2308 (VGAM2308) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32268] VGAM2308 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2308 was detected is described hereinabove with reference to Figs. 2-8.

[32269] VGAM2308 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2308 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32270] VGAM2308 gene, herein designated VGAM GENE, encodes a VGAM2308 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2308 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2308 precursor RNA is designated SEQ ID:2294, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2294 is located at position 123501 relative to the genome of Goatpox virus.

[32271] VGAM2308 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32272] An enzyme complex designated DICER COMPLEX, dices the VGAM2308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2308 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2308 RNA is designated SEQ ID:5019, and is provided hereinbelow with reference to the sequence listing part.

[32273] VGAM2308 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32274] VGAM2308 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2308 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2308 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32275] The complementary binding of VGAM2308 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2308 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32276] It is appreciated that VGAM2308 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2308 host target genes. The mRNA of each one of this plurality of VGAM2308 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2308 RNA, herein designated VGAM RNA, and which when bound by VGAM2308 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2308 host target proteins.

[32277] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2308 gene, herein designated VGAM GENE, on one or more VGAM2308 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32278] It is yet further appreciated that a function of VGAM2308 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2308 correlate with, and may be deduced from, the identity of the host target genes which VGAM2308 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32279] Nucleotide sequences of the VGAM2308 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2308 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2308 are further described hereinbelow with reference to Table 1.

[32280] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2308 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32281] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2309 (VGAM2309) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32282] VGAM2309 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2309 was detected is described hereinabove with reference to Figs. 2-8.

[32283] VGAM2309 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease virus. VGAM2309 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32284] VGAM2309 gene, herein designated VGAM GENE, encodes

a VGAM2309 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2309 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2309 precursor RNA is designated SEQ ID:2295, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2295 is located at position 127569 relative to the genome of lumpy skin disease virus.

[32285] VGAM2309 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32286] An enzyme complex designated DICER COMPLEX, dices the VGAM2309 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2309 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2309 RNA is designated SEQ ID:5020, and is provided hereinbelow with reference to the sequence listing part.

[32287] VGAM2309 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2309 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2309 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32288] VGAM2309 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2309 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2309 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2309 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2309 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32289] The complementary binding of VGAM2309 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2309 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2309

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2309 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32290] It is appreciated that VGAM2309 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2309 host target genes. The mRNA of each one of this plurality of VGAM2309 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2309 RNA, herein designated VGAM RNA, and which when bound by VGAM2309 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2309 host target proteins.

[32291] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2309 gene, herein designated VGAM GENE, on one or more VGAM2309 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32292] It is yet further appreciated that a function of VGAM2309 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2309 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2309 correlate with, and may be deduced from, the identity of the host target genes which VGAM2309 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32293] Nucleotide sequences of the VGAM2309 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2309 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2309 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2309 are further described hereinbelow with reference to Table 1.

[32294] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2309 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32295] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2310 (VGAM2310) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32296] VGAM2310 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2310 was detected is described hereinabove with reference to Figs. 2-8.

[32297] VGAM2310 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease virus. VGAM2310 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[32298] VGAM2310 gene, herein designated VGAM GENE, encodes a VGAM2310 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2310 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2310 precursor RNA is designated SEQ ID:2296, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2296 is located at position 135569 relative to the genome of lumpy skin disease virus.

[32299] VGAM2310 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32300] An enzyme complex designated DICER COMPLEX, dices the VGAM2310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2310 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2310 RNA is designated SEQ ID:5021, and is provided hereinbelow with reference to the sequence listing part.

[32301] VGAM2310 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2310 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2310 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32302] VGAM2310 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2310 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2310 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2310 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32303] The complementary binding of VGAM2310 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2310 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2310 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2310 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32304] It is appreciated that VGAM2310 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2310 host target genes. The mRNA of each one of this plurality of VGAM2310 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2310 RNA, herein designated VGAM RNA, and which when bound by VGAM2310 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2310 host target proteins.

[32305] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2310 gene, herein designated VGAM GENE, on one or more VGAM2310 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32306] It is yet further appreciated that a function of VGAM2310 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2310 correlate with, and may be deduced from, the identity of the host target genes which VGAM2310 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32307] Nucleotide sequences of the VGAM2310 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2310 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2310 are further described hereinbelow with reference to Table 1.

[32308] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2310 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32309] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2311 (VGAM2311) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32310] VGAM2311 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2311 was detected is described hereinabove with reference to Figs. 2-8.

[32311] VGAM2311 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease

virus. VGAM2311 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32312] VGAM2311 gene, herein designated VGAM GENE, encodes a VGAM2311 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2311 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2311 precursor RNA is designated SEQ ID:2297, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2297 is located at position 139025 relative to the genome of lumpy skin disease virus.

[32313] VGAM2311 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32314] An enzyme complex designated DICER COMPLEX, dices the VGAM2311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2311 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2311 RNA is designated SEQ ID:5022, and is provided hereinbelow with reference to the sequence listing part.

[32315] VGAM2311 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32316] VGAM2311 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2311 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32317] The complementary binding of VGAM2311 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2311 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32318] It is appreciated that VGAM2311 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2311 host target genes. The mRNA of each one of this plurality of VGAM2311 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2311 RNA, herein designated VGAM RNA, and which when bound by VGAM2311 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2311 host target proteins.

[32319] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2311 gene, herein designated VGAM GENE, on one or more VGAM2311 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32320] It is yet further appreciated that a function of VGAM2311 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2311 correlate with, and may be deduced from, the identity of the host target genes which VGAM2311 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32321] Nucleotide sequences of the VGAM2311 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2311 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2311 are further described hereinbelow with reference to Table 1.

[32322] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2311 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32323] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2312 (VGAM2312) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32324] VGAM2312 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2312 was detected is described hereinabove with reference to Figs. 2-8.

[32325] VGAM2312 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease virus. VGAM2312 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32326] VGAM2312 gene, herein designated VGAM GENE, encodes a VGAM2312 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2312 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2312 precursor RNA is designated SEQ ID:2298, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2298 is located at position 2051 relative to the genome of lumpy skin disease virus.

[32327] VGAM2312 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32328] An enzyme complex designated DICER COMPLEX, dices the VGAM2312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2312 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2312 RNA is designated SEQ ID:5023, and is provided hereinbelow with reference to the sequence listing part.

[32329] VGAM2312 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[32330] VGAM2312 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2312 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32331] The complementary binding of VGAM2312 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2312 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32332] It is appreciated that VGAM2312 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2312 host target genes. The mRNA of each one of this plurality of VGAM2312 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2312 RNA, herein designated VGAM RNA, and which when bound by VGAM2312 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2312 host target proteins.

[32333] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2312 gene, herein designated VGAM GENE, on one

or more VGAM2312 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32334] It is yet further appreciated that a function of VGAM2312 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2312 correlate with, and may be deduced from, the identity of the host target genes which VGAM2312 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32335] Nucleotide sequences of the VGAM2312 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2312 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2312 are further described hereinbelow with reference to Table 1.

[32336] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2312 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32337] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2313 (VGAM2313) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32338] VGAM2313 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2313 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[32339] VGAM2313 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease virus. VGAM2313 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32340] VGAM2313 gene, herein designated VGAM GENE, encodes a VGAM2313 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2313 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2313 precursor RNA is designated SEQ ID:2299, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2299 is located at position 146111 relative to the genome of lumpy skin disease virus.

[32341] VGAM2313 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32342] An enzyme complex designated DICER COMPLEX, dices the VGAM2313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2313 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2313 RNA is designated SEQ ID:5024, and is provided hereinbelow with reference to the sequence listing part.

[32343] VGAM2313 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32344] VGAM2313 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2313 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2313 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32345] The complementary binding of VGAM2313 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2313 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32346] It is appreciated that VGAM2313 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2313 host target genes. The mRNA of each one of this plurality of VGAM2313 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2313 RNA, herein designated VGAM RNA, and which when bound by VGAM2313 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2313 host target proteins.

[32347] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2313 gene, herein designated VGAM GENE, on one or more VGAM2313 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32348] It is yet further appreciated that a function of VGAM2313 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2313 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2313 correlate with, and may be deduced from, the identity of the host target genes which VGAM2313 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[32349] Nucleotide sequences of the VGAM2313 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2313 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2313 are further described hereinbelow with reference to Table 1.

[32350] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2313 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32351] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2314 (VGAM2314) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32352] VGAM2314 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2314 was detected is described hereinabove with reference to Figs. 2-8.

[32353] VGAM2314 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease virus. VGAM2314 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32354] VGAM2314 gene, herein designated VGAM GENE, encodes a VGAM2314 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2314 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2314 precursor RNA is designated SEQ ID:2300, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2300 is located at position 715 relative to the genome of lumpy skin disease virus.

[32355] VGAM2314 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32356] An enzyme complex designated DICER COMPLEX, dices the VGAM2314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2314 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2314 RNA is designated SEQ ID:5025, and is provided hereinbelow with reference to the sequence listing part.

[32357] VGAM2314 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32358] VGAM2314 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2314 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32359] The complementary binding of VGAM2314 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2314 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32360] It is appreciated that VGAM2314 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2314 host target genes. The mRNA of each one of this plurality of VGAM2314 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2314 RNA, herein designated VGAM RNA, and which when bound by VGAM2314 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2314 host target proteins.

[32361] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2314 gene, herein designated VGAM GENE, on one or more VGAM2314 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32362] It is yet further appreciated that a function of VGAM2314 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2314 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2314 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32363] Nucleotide sequences of the VGAM2314 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2314 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2314 are further described hereinbelow with reference to Table 1.

[32364] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2314 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32365] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2315 (VGAM2315) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32366] VGAM2315 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2315 was detected is described hereinabove with reference to Figs. 2-8.

[32367] VGAM2315 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease virus. VGAM2315 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32368] VGAM2315 gene, herein designated VGAM GENE, encodes a VGAM2315 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2315 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2315 precursor RNA is designated SEQ ID:2301, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2301 is located at position 128712 relative to the genome of lumpy skin disease virus.

[32369] VGAM2315 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2315 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32370] An enzyme complex designated DICER COMPLEX, dices the VGAM2315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2315 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2315 RNA is designated SEQ ID:5026, and is provided hereinbelow with reference to the sequence listing part.

[32371] VGAM2315 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2315 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2315 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32372] VGAM2315 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2315 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2315 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2315 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2315 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32373] The complementary binding of VGAM2315 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2315 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2315 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2315 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32374] It is appreciated that VGAM2315 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2315 host target genes. The mRNA of each one of this plurality of VGAM2315 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2315 RNA, herein designated VGAM RNA, and which when bound by VGAM2315 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2315 host target proteins.

[32375] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2315 gene, herein designated VGAM GENE, on one or more VGAM2315 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32376] It is yet further appreciated that a function of VGAM2315 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2315 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus.

Specific functions, and accordingly utilities, of VGAM2315 correlate with, and may be deduced from, the identity of the host target genes which VGAM2315 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32377] Nucleotide sequences of the VGAM2315 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2315 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2315 are further described hereinbelow with reference to Table 1.

[32378] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2315 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32379] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2316 (VGAM2316) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[32380] VGAM2316 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2316 was detected is described hereinabove with reference to Figs. 2-8.

[32381] VGAM2316 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2316 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32382] VGAM2316 gene, herein designated VGAM GENE, encodes a VGAM2316 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2316 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2316 precursor RNA is designated SEQ ID:2302, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2302 is located at position 33473 relative to the genome of Rana tigrina ranavirus.

[32383] VGAM2316 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32384] An enzyme complex designated DICER COMPLEX, dices the VGAM2316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2316 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2316 RNA is designated SEQ ID:5027, and is provided hereinbelow with reference to the sequence listing part.

[32385] VGAM2316 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2316 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2316 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32386] VGAM2316 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2316 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2316 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2316 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32387] The complementary binding of VGAM2316 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2316 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2316 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2316 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32388] It is appreciated that VGAM2316 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2316 host target genes. The mRNA of each one of this plurality of VGAM2316 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2316 RNA, herein designated VGAM RNA, and which when bound by VGAM2316 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2316 host target proteins.

[32389] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2316 gene, herein designated VGAM GENE, on one or more VGAM2316 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32390] It is yet further appreciated that a function of VGAM2316 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2316 include diagnosis, prevention and

treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2316 correlate with, and may be deduced from, the identity of the host target genes which VGAM2316 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32391] Nucleotide sequences of the VGAM2316 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2316 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2316 are further described hereinbelow with reference to Table 1.

[32392] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2316 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32393] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2317 (VGAM2317) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32394] VGAM2317 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2317 was detected is described hereinabove with reference to Figs. 2-8.

[32395] VGAM2317 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2317 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32396] VGAM2317 gene, herein designated VGAM GENE, encodes a VGAM2317 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2317 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2317 precursor RNA is designated SEQ ID:2303, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2303 is located at position 24685 relative to the genome of Rana tigrina ranavirus.

[32397] VGAM2317 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32398] An enzyme complex designated DICER COMPLEX, dices the VGAM2317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2317 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2317 RNA is designated SEQ ID:5028, and is provided hereinbelow with reference to the sequence listing part.

[32399] VGAM2317 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32400] VGAM2317 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2317 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2317 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32401] The complementary binding of VGAM2317 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2317 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32402] It is appreciated that VGAM2317 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2317 host target genes. The mRNA of each one of this plurality of VGAM2317 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2317 RNA, herein designated VGAM

RNA, and which when bound by VGAM2317 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2317 host target proteins.

[32403] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2317 gene, herein designated VGAM GENE, on one or more VGAM2317 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32404] It is yet further appreciated that a function of VGAM2317 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2317 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2317 correlate with, and may be deduced from, the identity of the host target genes which VGAM2317 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32405] Nucleotide sequences of the VGAM2317 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2317 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2317 are further described hereinbelow with reference to Table 1.

[32406] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2317 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32407] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2318 (VGAM2318) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32408] VGAM2318 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2318 was detected is described hereinabove with reference to Figs. 2-8.

[32409] VGAM2318 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2318 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32410] VGAM2318 gene, herein designated VGAM GENE, encodes a VGAM2318 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2318 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2318 precursor RNA is designated SEQ ID:2304, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2304 is located at position

35010 relative to the genome of Rana tigrina ranavirus.

[32411] VGAM2318 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32412] An enzyme complex designated DICER COMPLEX, dices the VGAM2318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2318 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2318 RNA is designated SEQ ID:5029, and is provided hereinbelow with reference to the sequence listing part.

[32413] VGAM2318 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32414] VGAM2318 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2318 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32415] The complementary binding of VGAM2318 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2318 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32416] It is appreciated that VGAM2318 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2318 host target genes. The mRNA of each one of this plurality of VGAM2318 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2318 RNA, herein designated VGAM RNA, and which when bound by VGAM2318 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2318 host target proteins.

[32417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2318 gene, herein designated VGAM GENE, on one or more VGAM2318 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32418] It is yet further appreciated that a function of VGAM2318 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2318 correlate with, and may be deduced from, the identity of the host target genes which VGAM2318 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32419] Nucleotide sequences of the VGAM2318 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2318 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2318 are further described hereinbelow with reference to Table 1.

[32420] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2318 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32421] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2319 (VGAM2319) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32422] VGAM2319 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2319 was detected is described hereinabove with reference to Figs. 2-8.

[32423] VGAM2319 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2319 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32424] VGAM2319 gene, herein designated VGAM GENE, encodes a VGAM2319 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2319 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2319 precursor RNA is designated SEQ ID:2305, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2305 is located at position 15762 relative to the genome of Rana tigrina ranavirus.

[32425] VGAM2319 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32426] An enzyme complex designated DICER COMPLEX, dices the VGAM2319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2319 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2319 RNA is designated SEQ ID:5030, and is provided hereinbelow with reference to the sequence

listing part.

[32427] VGAM2319 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32428] VGAM2319 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2319 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2319 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32429] The complementary binding of VGAM2319 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2319 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32430] It is appreciated that VGAM2319 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2319 host target genes. The mRNA of each one of this plurality of VGAM2319 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2319 RNA, herein designated VGAM RNA, and which when bound by VGAM2319 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2319 host target proteins.

[32431] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2319 gene, herein designated VGAM GENE, on one or more VGAM2319 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32432] It is yet further appreciated that a function of VGAM2319

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2319 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2319 correlate with, and may be deduced from, the identity of the host target genes which VGAM2319 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32433] Nucleotide sequences of the VGAM2319 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2319 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2319 are further described hereinbelow with reference to Table 1.

[32434] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2319 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32435] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2320 (VGAM2320) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32436] VGAM2320 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2320 was detected is described hereinabove with reference to Figs. 2-8.

[32437] VGAM2320 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2320 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32438] VGAM2320 gene, herein designated VGAM GENE, encodes a VGAM2320 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2320 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2320 precursor RNA is designated SEQ ID:2306, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2306 is located at position 28526 relative to the genome of Rana tigrina ranavirus.

[32439] VGAM2320 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32440] An enzyme complex designated DICER COMPLEX, dices the VGAM2320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2320 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2320 RNA is designated SEQ ID:5031, and

is provided hereinbelow with reference to the sequence listing part.

[32441] VGAM2320 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32442] VGAM2320 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2320 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32443] The complementary binding of VGAM2320 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2320 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32444] It is appreciated that VGAM2320 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2320 host target genes. The mRNA of each one of this plurality of VGAM2320 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2320 RNA, herein designated VGAM RNA, and which when bound by VGAM2320 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2320 host target proteins.

[32445] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2320 gene, herein designated VGAM GENE, on one or more VGAM2320 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32446] It is yet further appreciated that a function of VGAM2320 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2320 correlate with, and may be deduced from, the identity of the host target genes which VGAM2320 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32447] Nucleotide sequences of the VGAM2320 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2320 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2320 are further described hereinbelow with reference to Table 1.

[32448] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2320 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32449] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2321 (VGAM2321) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32450] VGAM2321 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2321 was detected is described hereinabove with reference to Figs. 2-8.

[32451] VGAM2321 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2321 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32452] VGAM2321 gene, herein designated VGAM GENE, encodes a VGAM2321 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2321 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2321 precur-

sor RNA is designated SEQ ID:2307, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2307 is located at position 24842 relative to the genome of Rana tigrina ranavirus.

[32453] VGAM2321 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32454] An enzyme complex designated DICER COMPLEX, dices the VGAM2321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2321 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM2321 RNA is designated SEQ ID:5032, and is provided hereinbelow with reference to the sequence listing part.

[32455] VGAM2321 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32456] VGAM2321 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2321 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32457] The complementary binding of VGAM2321 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2321 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32458] It is appreciated that VGAM2321 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2321 host target genes. The mRNA of

each one of this plurality of VGAM2321 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2321 RNA, herein designated VGAM RNA, and which when bound by VGAM2321 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2321 host target proteins.

[32459] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2321 gene, herein designated VGAM GENE, on one or more VGAM2321 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[32460] It is yet further appreciated that a function of VGAM2321 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2321 correlate with, and may be deduced from, the identity of the host target genes which VGAM2321 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32461] Nucleotide sequences of the VGAM2321 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2321 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2321 are further described hereinbelow with reference to Table 1.

[32462] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2321 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[32463] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2322 (VGAM2322) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32464] VGAM2322 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2322 was detected is described hereinabove with reference to Figs. 2-8.

[32465] VGAM2322 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2322 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32466] VGAM2322 gene, herein designated VGAM GENE, encodes a VGAM2322 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2322 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2322 precursor RNA is designated SEQ ID:2308, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2308 is located at position 49980 relative to the genome of Rana tigrina ranavirus.

[32467] VGAM2322 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32468] An enzyme complex designated DICER COMPLEX, dices the VGAM2322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2322 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2322 RNA is designated SEQ ID:5033, and is provided hereinbelow with reference to the sequence listing part.

[32469] VGAM2322 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2322 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2322 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32470] VGAM2322 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2322 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2322 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2322 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32471] The complementary binding of VGAM2322 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2322 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2322 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2322 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32472] It is appreciated that VGAM2322 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2322 host target genes. The mRNA of each one of this plurality of VGAM2322 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2322 RNA, herein designated VGAM RNA, and which when bound by VGAM2322 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2322 host target proteins.

[32473] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2322 gene, herein designated VGAM GENE, on one or more VGAM2322 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32474] It is yet further appreciated that a function of VGAM2322 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2322 correlate with, and may be deduced from, the identity of the host target genes which VGAM2322 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32475] Nucleotide sequences of the VGAM2322 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2322 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2322 are further described hereinbelow with reference to Table 1.

[32476] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2322 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32477] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2323 (VGAM2323) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32478] VGAM2323 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2323 was detected is described hereinabove with reference to Figs. 2-8.

[32479] VGAM2323 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2323 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32480] VGAM2323 gene, herein designated VGAM GENE, encodes a VGAM2323 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2323 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2323 precursor RNA is designated SEQ ID:2309, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2309 is located at position 27691 relative to the genome of Rana tigrina ranavirus.

[32481] VGAM2323 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32482] An enzyme complex designated DICER COMPLEX, dices the VGAM2323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2323 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2323 RNA is designated SEQ ID:5034, and is provided hereinbelow with reference to the sequence listing part.

[32483] VGAM2323 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32484] VGAM2323 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2323 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2323 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32485] The complementary binding of VGAM2323 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2323 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32486] It is appreciated that VGAM2323 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2323 host target genes. The mRNA of each one of this plurality of VGAM2323 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2323 RNA, herein designated VGAM RNA, and which when bound by VGAM2323 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2323 host target proteins.

[32487] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2323 gene, herein designated VGAM GENE, on one or more VGAM2323 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32488] It is yet further appreciated that a function of VGAM2323 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2323 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2323 correlate with, and may be deduced from, the identity of the host target genes which VGAM2323 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32489] Nucleotide sequences of the VGAM2323 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2323 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2323 are further described hereinbelow with reference to Table 1.

[32490] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2323 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32491] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2324 (VGAM2324) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32492] VGAM2324 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2324 was detected is described hereinabove with reference to Figs. 2-8.

[32493] VGAM2324 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2324 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32494] VGAM2324 gene, herein designated VGAM GENE, encodes a VGAM2324 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2324 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2324 precursor RNA is designated SEQ ID:2310, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2310 is located at position 26882 relative to the genome of Rana tigrina ranavirus.

[32495] VGAM2324 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32496] An enzyme complex designated DICER COMPLEX, dices the VGAM2324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2324 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2324 RNA is designated SEQ ID:5035, and is provided hereinbelow with reference to the sequence listing part.

[32497] VGAM2324 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32498] VGAM2324 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2324 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2324 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32499] The complementary binding of VGAM2324 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2324 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32500] It is appreciated that VGAM2324 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2324 host target genes. The mRNA of each one of this plurality of VGAM2324 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2324 RNA, herein designated VGAM RNA, and which when bound by VGAM2324 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2324 host target proteins.

[32501] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2324 gene, herein designated VGAM GENE, on one or more VGAM2324 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32502] It is yet further appreciated that a function of VGAM2324 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2324 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2324 correlate with, and may be deduced from, the identity of the host target genes which VGAM2324 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32503] Nucleotide sequences of the VGAM2324 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2324 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2324 are further described hereinbelow with reference to Table 1.

[32504] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2324 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32505] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2325 (VGAM2325) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32506] VGAM2325 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2325 was detected is described hereinabove with reference to Figs. 2-8.

[32507] VGAM2325 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2325 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32508] VGAM2325 gene, herein designated VGAM GENE, encodes a VGAM2325 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2325 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2325 precursor RNA is designated SEQ ID:2311, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2311 is located at position 28131 relative to the genome of Rana tigrina ranavirus.

[32509] VGAM2325 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32510] An enzyme complex designated DICER COMPLEX, dices the VGAM2325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2325 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2325 RNA is designated SEQ ID:5036, and is provided hereinbelow with reference to the sequence listing part.

[32511] VGAM2325 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2325 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2325 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32512] VGAM2325 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2325 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2325 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2325 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32513] The complementary binding of VGAM2325 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2325 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2325 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2325 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[32514] It is appreciated that VGAM2325 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2325 host target genes. The mRNA of each one of this plurality of VGAM2325 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2325 RNA, herein designated VGAM RNA, and which when bound by VGAM2325 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2325 host target proteins.

[32515] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2325 gene, herein designated VGAM GENE, on one or more VGAM2325 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32516] It is yet further appreciated that a function of VGAM2325 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2325 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2325 correlate with, and may be deduced from, the identity of the host target genes which VGAM2325 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32517] Nucleotide sequences of the VGAM2325 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2325 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2325 are further described hereinbelow with reference to Table 1.

[32518] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2325 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32519] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2326 (VGAM2326) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32520] VGAM2326 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2326 was detected is described hereinabove with reference to Figs. 2-8.

[32521] VGAM2326 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2326 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32522] VGAM2326 gene, herein designated VGAM GENE, encodes a VGAM2326 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2326 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2326 precursor RNA is designated SEQ ID:2312, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2312 is located at position 37660 relative to the genome of Rana tigrina ranavirus.

[32523] VGAM2326 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32524] An enzyme complex designated DICER COMPLEX, dices the VGAM2326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2326 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2326 RNA is designated SEQ ID:5037, and is provided hereinbelow with reference to the sequence listing part.

[32525] VGAM2326 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32526] VGAM2326 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2326 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2326 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32527] The complementary binding of VGAM2326 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2326 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32528] It is appreciated that VGAM2326 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2326 host target genes. The mRNA of each one of this plurality of VGAM2326 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2326 RNA, herein designated VGAM RNA, and which when bound by VGAM2326 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2326 host target proteins.

[32529] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2326 gene, herein designated VGAM GENE, on one or more VGAM2326 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32530] It is yet further appreciated that a function of VGAM2326 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2326 correlate with, and may be deduced from, the identity of the host target genes which VGAM2326 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32531] Nucleotide sequences of the VGAM2326 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2326 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2326 are further described hereinbelow with reference to Table 1.

[32532] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2326 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32533] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2327 (VGAM2327) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32534] VGAM2327 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2327 was detected is described hereinabove with reference to Figs. 2-8.

[32535] VGAM2327 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2327 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32536] VGAM2327 gene, herein designated VGAM GENE, encodes

a VGAM2327 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2327 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2327 precursor RNA is designated SEQ ID:2313, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2313 is located at position 30986 relative to the genome of Rana tigrina ranavirus.

[32537] VGAM2327 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32538] An enzyme complex designated DICER COMPLEX, dices the VGAM2327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2327 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM2327 RNA is designated SEQ ID:5038, and is provided hereinbelow with reference to the sequence listing part.

[32539] VGAM2327 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2327 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2327 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32540] VGAM2327 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2327 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2327 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2327 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2327 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32541] The complementary binding of VGAM2327 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2327 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2327 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2327 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32542] It is appreciated that VGAM2327 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2327 host target genes. The mRNA of each one of this plurality of VGAM2327 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2327 RNA, herein designated VGAM RNA, and which when bound by VGAM2327 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2327 host target proteins.

[32543] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2327 gene, herein designated VGAM GENE, on one or more VGAM2327 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32544] It is yet further appreciated that a function of VGAM2327 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2327 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2327 correlate with, and may be deduced from, the identity of the host target genes which VGAM2327 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32545] Nucleotide sequences of the VGAM2327 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2327 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2327 are further

described hereinbelow with reference to Table 1.

[32546] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2327 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32547] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2328 (VGAM2328) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32548] VGAM2328 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2328 was detected is described hereinabove with reference to Figs. 2-8.

[32549] VGAM2328 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2328 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32550] VGAM2328 gene, herein designated VGAM GENE, encodes a VGAM2328 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2328 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2328 precursor RNA is designated SEQ ID:2314, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2314 is located at position 16752 relative to the genome of Rana tigrina ranavirus.

[32551] VGAM2328 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32552] An enzyme complex designated DICER COMPLEX, dices the VGAM2328 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2328 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2328 RNA is designated SEQ ID:5039, and is provided hereinbelow with reference to the sequence listing part.

[32553] VGAM2328 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2328 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2328 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32554] VGAM2328 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2328 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2328 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2328 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32555] The complementary binding of VGAM2328 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2328 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2328

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2328 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32556] It is appreciated that VGAM2328 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2328 host target genes. The mRNA of each one of this plurality of VGAM2328 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2328 RNA, herein designated VGAM RNA, and which when bound by VGAM2328 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2328 host target proteins.

[32557] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2328 gene, herein designated VGAM GENE, on one or more VGAM2328 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32558] It is yet further appreciated that a function of VGAM2328 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2328 correlate with, and may be deduced from, the identity of the host target genes which VGAM2328 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32559] Nucleotide sequences of the VGAM2328 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2328 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2328 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2328 are further described hereinbelow with reference to Table 1.

[32560] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2328 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32561] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2329 (VGAM2329) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32562] VGAM2329 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2329 was detected is described hereinabove with reference to Figs. 2-8.

[32563] VGAM2329 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2329 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[32564] VGAM2329 gene, herein designated VGAM GENE, encodes a VGAM2329 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2329 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2329 precursor RNA is designated SEQ ID:2315, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2315 is located at position 39739 relative to the genome of Equine herpesvirus 2.

[32565] VGAM2329 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32566] An enzyme complex designated DICER COMPLEX, dices

the VGAM2329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2329 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2329 RNA is designated SEQ ID:5040, and is provided hereinbelow with reference to the sequence listing part.

[32567] VGAM2329 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2329 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2329 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32568] VGAM2329 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2329 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2329 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2329 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32569] The complementary binding of VGAM2329 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2329 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2329 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2329 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32570] It is appreciated that VGAM2329 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2329 host target genes. The mRNA of each one of this plurality of VGAM2329 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2329 RNA, herein designated VGAM RNA, and which when bound by VGAM2329 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2329 host target proteins.

[32571] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2329 gene, herein designated VGAM GENE, on one or more VGAM2329 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32572] It is yet further appreciated that a function of VGAM2329 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2329 correlate with, and may be deduced from, the identity of the host target genes which VGAM2329 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32573] Nucleotide sequences of the VGAM2329 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2329 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2329 are further described hereinbelow with reference to Table 1.

[32574] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2329 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32575] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2330 (VGAM2330) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32576] VGAM2330 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2330 was detected is described hereinabove with reference to Figs. 2-8.

[32577] VGAM2330 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2330 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[32578] VGAM2330 gene, herein designated VGAM GENE, encodes a VGAM2330 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2330 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2330 precursor RNA is designated SEQ ID:2316, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2316 is located at position 1147 relative to the genome of Equine herpesvirus 2.

[32579] VGAM2330 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32580] An enzyme complex designated DICER COMPLEX, dices the VGAM2330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2330 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2330 RNA is designated SEQ ID:5041, and is provided hereinbelow with reference to the sequence listing part.

[32581] VGAM2330 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2330 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2330 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32582] VGAM2330 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2330 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2330 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2330 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32583] The complementary binding of VGAM2330 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2330 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2330 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2330 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32584] It is appreciated that VGAM2330 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2330 host target genes. The mRNA of each one of this plurality of VGAM2330 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2330 RNA, herein designated VGAM RNA, and which when bound by VGAM2330 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2330 host target proteins.

[32585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2330 gene, herein designated VGAM GENE, on one or more VGAM2330 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32586] It is yet further appreciated that a function of VGAM2330 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2330 correlate with, and may be deduced from, the identity of the host target genes which VGAM2330 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32587] Nucleotide sequences of the VGAM2330 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2330 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2330 are further described hereinbelow with reference to Table 1.

[32588] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2330 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32589] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2331 (VGAM2331) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32590] VGAM2331 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2331 was detected is described hereinabove with reference to Figs. 2-8.

[32591] VGAM2331 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2.

VGAM2331 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32592] VGAM2331 gene, herein designated VGAM GENE, encodes a VGAM2331 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2331 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2331 precursor RNA is designated SEQ ID:2317, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2317 is located at position 42566 relative to the genome of Equine herpesvirus 2.

[32593] VGAM2331 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[32594] An enzyme complex designated DICER COMPLEX, dices the VGAM2331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2331 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2331 RNA is designated SEQ ID:5042, and is provided hereinbelow with reference to the sequence listing part.

[32595] VGAM2331 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2331 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2331 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32596] VGAM2331 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2331 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2331 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2331 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2331 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32597] The complementary binding of VGAM2331 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2331 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2331 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2331 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32598] It is appreciated that VGAM2331 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2331 host target genes. The mRNA of each one of this plurality of VGAM2331 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2331 RNA, herein designated VGAM RNA, and which when bound by VGAM2331 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2331 host target proteins.

[32599] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2331 gene, herein designated VGAM GENE, on one or more VGAM2331 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32600] It is yet further appreciated that a function of VGAM2331 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2331 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2331 correlate with, and may be deduced from, the identity of the host target genes which VGAM2331 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32601] Nucleotide sequences of the VGAM2331 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2331 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2331 are further described hereinbelow with reference to Table 1.

[32602] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2331 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32603] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2332 (VGAM2332) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32604] VGAM2332 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2332 was detected is described hereinabove with reference to Figs. 2-8.

[32605] VGAM2332 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine herpesvirus 2. VGAM2332 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32606] VGAM2332 gene, herein designated VGAM GENE, encodes a VGAM2332 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2332 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2332 precursor RNA is designated SEQ ID:2318, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2318 is located at position 21991 relative to the genome of Equine herpesvirus 2.

[32607] VGAM2332 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32608] An enzyme complex designated DICER COMPLEX, dices the VGAM2332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2332 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2332 RNA is designated SEQ ID:5043, and is provided hereinbelow with reference to the sequence listing part.

[32609] VGAM2332 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32610] VGAM2332 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2332 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2332 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32611] The complementary binding of VGAM2332 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2332 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32612] It is appreciated that VGAM2332 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2332 host target genes. The mRNA of each one of this plurality of VGAM2332 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2332 RNA, herein designated VGAM RNA, and which when bound by VGAM2332 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2332 host target proteins.

[32613] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2332 gene, herein designated VGAM GENE, on one or more VGAM2332 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32614] It is yet further appreciated that a function of VGAM2332 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2332 correlate with, and may be deduced from, the identity of the host target genes which VGAM2332 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32615] Nucleotide sequences of the VGAM2332 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2332 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2332 are further described hereinbelow with reference to Table 1.

[32616] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2332 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32617] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2333 (VGAM2333) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32618] VGAM2333 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2333 was detected is described hereinabove with reference to Figs. 2-8.

[32619] VGAM2333 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2333 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32620] VGAM2333 gene, herein designated VGAM GENE, encodes a VGAM2333 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2333 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2333 precursor RNA is designated SEQ ID:2319, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2319 is located at position 36149 relative to the genome of Equine herpesvirus 2.

[32621] VGAM2333 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32622] An enzyme complex designated DICER COMPLEX, dices the VGAM2333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2333 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2333 RNA is designated SEQ ID:5044, and is provided hereinbelow with reference to the sequence listing part.

[32623] VGAM2333 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[32624] VGAM2333 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2333 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32625] The complementary binding of VGAM2333 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2333 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32626] It is appreciated that VGAM2333 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2333 host target genes. The mRNA of each one of this plurality of VGAM2333 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2333 RNA, herein designated VGAM RNA, and which when bound by VGAM2333 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2333 host target proteins.

[32627] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2333 gene, herein designated VGAM GENE, on one or more VGAM2333 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32628] It is yet further appreciated that a function of VGAM2333 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2333

correlate with, and may be deduced from, the identity of the host target genes which VGAM2333 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32629] Nucleotide sequences of the VGAM2333 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2333 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2333 are further described hereinbelow with reference to Table 1.

[32630] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2333 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32631] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2334 (VGAM2334) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[32632] VGAM2334 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2334 was detected is described hereinabove with reference to Figs. 2-8.

[32633] VGAM2334 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2334 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32634] VGAM2334 gene, herein designated VGAM GENE, encodes a VGAM2334 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2334 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2334 precursor RNA is designated SEQ ID:2320, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2320 is located at position 40967 relative to the genome of Equine herpesvirus 2.

[32635] VGAM2334 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2334 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32636] An enzyme complex designated DICER COMPLEX, dices the VGAM2334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2334 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2334 RNA is designated SEQ ID:5045, and is provided hereinbelow with reference to the sequence listing part.

[32637] VGAM2334 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2334 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2334 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32638] VGAM2334 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2334 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2334 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2334 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32639] The complementary binding of VGAM2334 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2334 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2334 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2334 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32640] It is appreciated that VGAM2334 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2334 host target genes. The mRNA of each one of this plurality of VGAM2334 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2334 RNA, herein designated VGAM RNA, and which when bound by VGAM2334 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2334 host target proteins.

[32641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2334 gene, herein designated VGAM GENE, on one or more VGAM2334 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32642] It is yet further appreciated that a function of VGAM2334 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM2334 correlate with, and may be deduced from, the identity of the host target genes which VGAM2334 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32643] Nucleotide sequences of the VGAM2334 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2334 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2334 are further described hereinbelow with reference to Table 1.

[32644] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2334 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32645] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2335 (VGAM2335) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[32646] VGAM2335 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2335 was detected is described hereinabove with reference to Figs. 2-8.

[32647] VGAM2335 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2335 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32648] VGAM2335 gene, herein designated VGAM GENE, encodes a VGAM2335 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2335 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2335 precursor RNA is designated SEQ ID:2321, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2321 is located at position 42087 relative to the genome of Equine herpesvirus 2.

[32649] VGAM2335 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32650] An enzyme complex designated DICER COMPLEX, dices the VGAM2335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2335 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2335 RNA is designated SEQ ID:5046, and is provided hereinbelow with reference to the sequence listing part.

[32651] VGAM2335 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2335 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2335 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32652] VGAM2335 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2335 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2335 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2335 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32653] The complementary binding of VGAM2335 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2335 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2335 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2335 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32654] It is appreciated that VGAM2335 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2335 host target genes. The mRNA of each one of this plurality of VGAM2335 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2335 RNA, herein designated VGAM RNA, and which when bound by VGAM2335 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2335 host target proteins.

[32655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2335 gene, herein designated VGAM GENE, on one or more VGAM2335 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32656] It is yet further appreciated that a function of VGAM2335 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2335 include diagnosis, prevention and

treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2335 correlate with, and may be deduced from, the identity of the host target genes which VGAM2335 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32657] Nucleotide sequences of the VGAM2335 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2335 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2335 are further described hereinbelow with reference to Table 1.

[32658] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2335 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32659] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2336 (VGAM2336) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32660] VGAM2336 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2336 was detected is described hereinabove with reference to Figs. 2-8.

[32661] VGAM2336 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2336 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32662] VGAM2336 gene, herein designated VGAM GENE, encodes a VGAM2336 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2336 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2336 precursor RNA is designated SEQ ID:2322, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2322 is located at position 40488 relative to the genome of Equine herpesvirus 2.

[32663] VGAM2336 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32664] An enzyme complex designated DICER COMPLEX, dices the VGAM2336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2336 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2336 RNA is designated SEQ ID:5047, and is provided hereinbelow with reference to the sequence listing part.

[32665] VGAM2336 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32666] VGAM2336 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2336 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2336 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32667] The complementary binding of VGAM2336 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2336 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32668] It is appreciated that VGAM2336 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2336 host target genes. The mRNA of each one of this plurality of VGAM2336 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2336 RNA, herein designated VGAM

RNA, and which when bound by VGAM2336 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2336 host target proteins.

[32669] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2336 gene, herein designated VGAM GENE, on one or more VGAM2336 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32670] It is yet further appreciated that a function of VGAM2336 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2336 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2336 correlate with, and may be deduced from, the identity of the host target genes which VGAM2336 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32671] Nucleotide sequences of the VGAM2336 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2336 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2336 are further described hereinbelow with reference to Table 1.

[32672] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2336 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32673] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2337 (VGAM2337) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32674] VGAM2337 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2337 was detected is described hereinabove with reference to Figs. 2-8.

[32675] VGAM2337 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2337 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32676] VGAM2337 gene, herein designated VGAM GENE, encodes a VGAM2337 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2337 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2337 precursor RNA is designated SEQ ID:2323, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2323 is located at position

42439 relative to the genome of Equine herpesvirus 2.

[32677] VGAM2337 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32678] An enzyme complex designated DICER COMPLEX, dices the VGAM2337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2337 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2337 RNA is designated SEQ ID:5048, and is provided hereinbelow with reference to the sequence listing part.

[32679] VGAM2337 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32680] VGAM2337 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2337 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32681] The complementary binding of VGAM2337 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2337 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32682] It is appreciated that VGAM2337 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2337 host target genes. The mRNA of each one of this plurality of VGAM2337 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2337 RNA, herein designated VGAM RNA, and which when bound by VGAM2337 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2337 host target proteins.

[32683] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2337 gene, herein designated VGAM GENE, on one or more VGAM2337 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32684] It is yet further appreciated that a function of VGAM2337 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2337 correlate with, and may be deduced from, the identity of the host target genes which VGAM2337 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32685] Nucleotide sequences of the VGAM2337 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2337 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2337 are further described hereinbelow with reference to Table 1.

[32686] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2337 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32687] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2338 (VGAM2338) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32688] VGAM2338 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2338 was detected is described hereinabove with reference to Figs. 2-8.

[32689] VGAM2338 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2338 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32690] VGAM2338 gene, herein designated VGAM GENE, encodes a VGAM2338 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2338 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2338 precursor RNA is designated SEQ ID:2324, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2324 is located at position 36402 relative to the genome of Equine herpesvirus 2.

[32691] VGAM2338 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32692] An enzyme complex designated DICER COMPLEX, dices the VGAM2338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2338 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2338 RNA is designated SEQ ID:5049, and is provided hereinbelow with reference to the sequence

listing part.

[32693] VGAM2338 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32694] VGAM2338 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2338 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32695] The complementary binding of VGAM2338 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2338 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32696] It is appreciated that VGAM2338 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2338 host target genes. The mRNA of each one of this plurality of VGAM2338 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2338 RNA, herein designated VGAM RNA, and which when bound by VGAM2338 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2338 host target proteins.

[32697] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2338 gene, herein designated VGAM GENE, on one or more VGAM2338 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32698] It is yet further appreciated that a function of VGAM2338

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2338 correlate with, and may be deduced from, the identity of the host target genes which VGAM2338 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32699] Nucleotide sequences of the VGAM2338 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2338 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2338 are further described hereinbelow with reference to Table 1.

[32700] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2338 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32701] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2339 (VGAM2339) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32702] VGAM2339 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2339 was detected is described hereinabove with reference to Figs. 2-8.

[32703] VGAM2339 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2339 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32704] VGAM2339 gene, herein designated VGAM GENE, encodes a VGAM2339 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2339 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2339 precursor RNA is designated SEQ ID:2325, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2325 is located at position 42978 relative to the genome of Equine herpesvirus 2.

[32705] VGAM2339 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32706] An enzyme complex designated DICER COMPLEX, dices the VGAM2339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2339 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM2339 RNA is designated SEQ ID:5050, and

is provided hereinbelow with reference to the sequence listing part.

[32707] VGAM2339 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32708] VGAM2339 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2339 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2339 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32709] The complementary binding of VGAM2339 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2339 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32710] It is appreciated that VGAM2339 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2339 host target genes. The mRNA of each one of this plurality of VGAM2339 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2339 RNA, herein designated VGAM RNA, and which when bound by VGAM2339 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2339 host target proteins.

[32711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2339 gene, herein designated VGAM GENE, on one or more VGAM2339 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32712] It is yet further appreciated that a function of VGAM2339 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2339 correlate with, and may be deduced from, the identity of the host target genes which VGAM2339 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32713] Nucleotide sequences of the VGAM2339 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2339 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2339 are further described hereinbelow with reference to Table 1.

[32714] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2339 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32715] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2340 (VGAM2340) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32716] VGAM2340 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2340 was detected is described hereinabove with reference to Figs. 2-8.

[32717] VGAM2340 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2340 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32718] VGAM2340 gene, herein designated VGAM GENE, encodes a VGAM2340 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2340 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2340 precur-

sor RNA is designated SEQ ID:2326, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2326 is located at position 42263 relative to the genome of Equine herpesvirus 2.

[32719] VGAM2340 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32720] An enzyme complex designated DICER COMPLEX, dices the VGAM2340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2340 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM2340 RNA is designated SEQ ID:5051, and is provided hereinbelow with reference to the sequence listing part.

[32721] VGAM2340 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32722] VGAM2340 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2340 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32723] The complementary binding of VGAM2340 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2340 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32724] It is appreciated that VGAM2340 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2340 host target genes. The mRNA of

each one of this plurality of VGAM2340 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2340 RNA, herein designated VGAM RNA, and which when bound by VGAM2340 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2340 host target proteins.

[32725] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2340 gene, herein designated VGAM GENE, on one or more VGAM2340 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[32726] It is yet further appreciated that a function of VGAM2340 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2340 correlate with, and may be deduced from, the identity of the host target genes which VGAM2340 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32727] Nucleotide sequences of the VGAM2340 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2340 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2340 are further described hereinbelow with reference to Table 1.

[32728] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2340 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[32729] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2341 (VGAM2341) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32730] VGAM2341 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2341 was detected is described hereinabove with reference to Figs. 2-8.

[32731] VGAM2341 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2341 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32732] VGAM2341 gene, herein designated VGAM GENE, encodes a VGAM2341 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2341 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2341 precursor RNA is designated SEQ ID:2327, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2327 is located at position 38415 relative to the genome of Equine herpesvirus 2.

[32733] VGAM2341 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32734] An enzyme complex designated DICER COMPLEX, dices the VGAM2341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2341 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2341 RNA is designated SEQ ID:5052, and is provided hereinbelow with reference to the sequence listing part.

[32735] VGAM2341 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2341 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2341 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32736] VGAM2341 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2341 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2341 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2341 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32737] The complementary binding of VGAM2341 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2341 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2341 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2341 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32738] It is appreciated that VGAM2341 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2341 host target genes. The mRNA of each one of this plurality of VGAM2341 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2341 RNA, herein designated VGAM RNA, and which when bound by VGAM2341 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2341 host target proteins.

[32739] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2341 gene, herein designated VGAM GENE, on one or more VGAM2341 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32740] It is yet further appreciated that a function of VGAM2341 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2341 correlate with, and may be deduced from, the identity of the host target genes which VGAM2341 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32741] Nucleotide sequences of the VGAM2341 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2341 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2341 are further described hereinbelow with reference to Table 1.

[32742] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2341 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32743] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2342 (VGAM2342) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32744] VGAM2342 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2342 was detected is described hereinabove with reference to Figs. 2-8.

[32745] VGAM2342 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2342 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32746] VGAM2342 gene, herein designated VGAM GENE, encodes a VGAM2342 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2342 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2342 precursor RNA is designated SEQ ID:2328, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2328 is located at position 43910 relative to the genome of Equine herpesvirus 2.

[32747] VGAM2342 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32748] An enzyme complex designated DICER COMPLEX, dices the VGAM2342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2342 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2342 RNA is designated SEQ ID:5053, and is provided hereinbelow with reference to the sequence listing part.

[32749] VGAM2342 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32750] VGAM2342 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2342 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32751] The complementary binding of VGAM2342 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2342 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32752] It is appreciated that VGAM2342 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2342 host target genes. The mRNA of each one of this plurality of VGAM2342 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2342 RNA, herein designated VGAM RNA, and which when bound by VGAM2342 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2342 host target proteins.

[32753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2342 gene, herein designated VGAM GENE, on one or more VGAM2342 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32754] It is yet further appreciated that a function of VGAM2342 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2342 correlate with, and may be deduced from, the identity of the host target genes which VGAM2342 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32755] Nucleotide sequences of the VGAM2342 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2342 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2342 are further described hereinbelow with reference to Table 1.

[32756] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2342 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32757] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2343 (VGAM2343) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32758] VGAM2343 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2343 was detected is described hereinabove with reference to Figs. 2-8.

[32759] VGAM2343 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2343 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32760] VGAM2343 gene, herein designated VGAM GENE, encodes a VGAM2343 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2343 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2343 precursor RNA is designated SEQ ID:2329, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2329 is located at position 43126 relative to the genome of Equine herpesvirus 2.

[32761] VGAM2343 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32762] An enzyme complex designated DICER COMPLEX, dices the VGAM2343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2343 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2343 RNA is designated SEQ ID:5054, and is provided hereinbelow with reference to the sequence listing part.

[32763] VGAM2343 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32764] VGAM2343 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2343 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2343 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32765] The complementary binding of VGAM2343 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2343 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32766] It is appreciated that VGAM2343 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2343 host target genes. The mRNA of each one of this plurality of VGAM2343 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2343 RNA, herein designated VGAM RNA, and which when bound by VGAM2343 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2343 host target proteins.

[32767] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2343 gene, herein designated VGAM GENE, on one or more VGAM2343 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32768] It is yet further appreciated that a function of VGAM2343 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2343 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2343 correlate with, and may be deduced from, the identity of the host target genes which VGAM2343 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32769] Nucleotide sequences of the VGAM2343 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2343 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2343 are further described hereinbelow with reference to Table 1.

[32770] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2343 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32771] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2344 (VGAM2344) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32772] VGAM2344 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2344 was detected is described hereinabove with reference to Figs. 2-8.

[32773] VGAM2344 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2344 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32774] VGAM2344 gene, herein designated VGAM GENE, encodes a VGAM2344 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2344 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2344 precursor RNA is designated SEQ ID:2330, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2330 is located at position 38540 relative to the genome of Equine herpesvirus 2.

[32775] VGAM2344 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32776] An enzyme complex designated DICER COMPLEX, dices the VGAM2344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2344 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM2344 RNA is designated SEQ ID:5055, and is provided hereinbelow with reference to the sequence listing part.

[32777] VGAM2344 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32778] VGAM2344 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2344 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2344 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32779] The complementary binding of VGAM2344 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2344 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[32780] It is appreciated that VGAM2344 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2344 host target genes. The mRNA of each one of this plurality of VGAM2344 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2344 RNA, herein designated VGAM RNA, and which when bound by VGAM2344 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2344 host target proteins.

[32781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2344 gene, herein designated VGAM GENE, on one or more VGAM2344 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32782] It is yet further appreciated that a function of VGAM2344 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2344 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2344 correlate with, and may be deduced from, the identity of the host target genes which VGAM2344 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32783] Nucleotide sequences of the VGAM2344 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2344 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2344 are further described hereinbelow with reference to Table 1.

[32784] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2344 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32785] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2345 (VGAM2345) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32786] VGAM2345 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2345 was detected is described hereinabove with reference to Figs. 2-8.

[32787] VGAM2345 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2345 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32788] VGAM2345 gene, herein designated VGAM GENE, encodes a VGAM2345 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2345 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2345 precursor RNA is designated SEQ ID:2331, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2331 is located at position 41319 relative to the genome of Equine herpesvirus 2.

[32789] VGAM2345 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32790] An enzyme complex designated DICER COMPLEX, dices the VGAM2345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2345 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2345 RNA is designated SEQ ID:5056, and is provided hereinbelow with reference to the sequence listing part.

[32791] VGAM2345 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2345 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2345 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32792] VGAM2345 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2345 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2345 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2345 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2345 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32793] The complementary binding of VGAM2345 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2345 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2345 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2345 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32794] It is appreciated that VGAM2345 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2345 host target genes. The mRNA of each one of this plurality of VGAM2345 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2345 RNA, herein designated VGAM RNA, and which when bound by VGAM2345 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2345 host target proteins.

[32795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2345 gene, herein designated VGAM GENE, on one or more VGAM2345 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32796] It is yet further appreciated that a function of VGAM2345 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2345 correlate with, and may be deduced from, the identity of the host target genes which VGAM2345 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32797] Nucleotide sequences of the VGAM2345 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2345 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2345 are further described hereinbelow with reference to Table 1.

[32798] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2345 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32799] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2346 (VGAM2346) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32800] VGAM2346 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2346 was detected is described hereinabove with reference to Figs. 2-8.

[32801] VGAM2346 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2346 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32802] VGAM2346 gene, herein designated VGAM GENE, encodes

a VGAM2346 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2346 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2346 precursor RNA is designated SEQ ID:2332, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2332 is located at position 38013 relative to the genome of Equine herpesvirus 2.

[32803] VGAM2346 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32804] An enzyme complex designated DICER COMPLEX, dices the VGAM2346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2346 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2346 RNA is designated SEQ ID:5057, and is provided hereinbelow with reference to the sequence listing part.

[32805] VGAM2346 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2346 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2346 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32806] VGAM2346 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2346 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2346 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2346 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32807] The complementary binding of VGAM2346 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2346 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2346 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2346 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32808] It is appreciated that VGAM2346 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2346 host target genes. The mRNA of each one of this plurality of VGAM2346 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2346 RNA, herein designated VGAM RNA, and which when bound by VGAM2346 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2346 host target proteins.

[32809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2346 gene, herein designated VGAM GENE, on one or more VGAM2346 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32810] It is yet further appreciated that a function of VGAM2346 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2346 correlate with, and may be deduced from, the identity of the host target genes which VGAM2346 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32811] Nucleotide sequences of the VGAM2346 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2346 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2346 are further

described hereinbelow with reference to Table 1.

[32812] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2346 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32813] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2347 (VGAM2347) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32814] VGAM2347 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2347 was detected is described hereinabove with reference to Figs. 2-8.

[32815] VGAM2347 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2347 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32816] VGAM2347 gene, herein designated VGAM GENE, encodes a VGAM2347 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2347 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2347 precursor RNA is designated SEQ ID:2333, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2333 is located at position 44095 relative to the genome of Equine herpesvirus 2.

[32817] VGAM2347 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32818] An enzyme complex designated DICER COMPLEX, dices the VGAM2347 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2347 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2347 RNA is designated SEQ ID:5058, and is provided hereinbelow with reference to the sequence listing part.

[32819] VGAM2347 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2347 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2347 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32820] VGAM2347 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2347 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2347 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2347 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32821] The complementary binding of VGAM2347 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2347 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2347

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2347 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32822] It is appreciated that VGAM2347 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2347 host target genes. The mRNA of each one of this plurality of VGAM2347 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2347 RNA, herein designated VGAM RNA, and which when bound by VGAM2347 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2347 host target proteins.

[32823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2347 gene, herein designated VGAM GENE, on one or more VGAM2347 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32824] It is yet further appreciated that a function of VGAM2347 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2347 correlate with, and may be deduced from, the identity of the host target genes which VGAM2347 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32825] Nucleotide sequences of the VGAM2347 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2347 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2347 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2347 are further described hereinbelow with reference to Table 1.

[32826] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2347 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32827] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2348 (VGAM2348) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32828] VGAM2348 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2348 was detected is described hereinabove with reference to Figs. 2-8.

[32829] VGAM2348 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2348 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[32830] VGAM2348 gene, herein designated VGAM GENE, encodes a VGAM2348 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2348 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2348 precursor RNA is designated SEQ ID:2334, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2334 is located at position 16485 relative to the genome of Equine herpesvirus 2.

[32831] VGAM2348 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32832] An enzyme complex designated DICER COMPLEX, dices

the VGAM2348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2348 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2348 RNA is designated SEQ ID:5059, and is provided hereinbelow with reference to the sequence listing part.

[32833] VGAM2348 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2348 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2348 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32834] VGAM2348 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2348 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2348 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2348 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2348 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32835] The complementary binding of VGAM2348 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2348 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2348 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2348 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32836] It is appreciated that VGAM2348 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2348 host target genes. The mRNA of each one of this plurality of VGAM2348 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2348 RNA, herein designated VGAM RNA, and which when bound by VGAM2348 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2348 host target proteins.

[32837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2348 gene, herein designated VGAM GENE, on one or more VGAM2348 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32838] It is yet further appreciated that a function of VGAM2348 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2348 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2348 correlate with, and may be deduced from, the identity of the host target genes which VGAM2348 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32839] Nucleotide sequences of the VGAM2348 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2348 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2348 are further described hereinbelow with reference to Table 1.

[32840] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2348 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32841] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2349 (VGAM2349) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32842] VGAM2349 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2349 was detected is described hereinabove with reference to Figs. 2-8.

[32843] VGAM2349 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2349 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[32844] VGAM2349 gene, herein designated VGAM GENE, encodes a VGAM2349 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2349 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2349 precursor RNA is designated SEQ ID:2335, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2335 is located at position 19286 relative to the genome of Equine herpesvirus 2.

[32845] VGAM2349 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32846] An enzyme complex designated DICER COMPLEX, dices the VGAM2349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2349 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2349 RNA is designated SEQ ID:5060, and is provided hereinbelow with reference to the sequence listing part.

[32847] VGAM2349 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2349 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2349 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32848] VGAM2349 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2349 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2349 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2349 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32849] The complementary binding of VGAM2349 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2349 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2349 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2349 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32850] It is appreciated that VGAM2349 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2349 host target genes. The mRNA of each one of this plurality of VGAM2349 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2349 RNA, herein designated VGAM RNA, and which when bound by VGAM2349 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2349 host target proteins.

[32851] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2349 gene, herein designated VGAM GENE, on one or more VGAM2349 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32852] It is yet further appreciated that a function of VGAM2349 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2349 correlate with, and may be deduced from, the identity of the host target genes which VGAM2349 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32853] Nucleotide sequences of the VGAM2349 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2349 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2349 are further described hereinbelow with reference to Table 1.

[32854] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2349 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32855] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2350 (VGAM2350) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32856] VGAM2350 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2350 was detected is described hereinabove with reference to Figs. 2-8.

[32857] VGAM2350 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2.

VGAM2350 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32858] VGAM2350 gene, herein designated VGAM GENE, encodes a VGAM2350 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2350 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2350 precursor RNA is designated SEQ ID:2336, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2336 is located at position 13649 relative to the genome of Equine herpesvirus 2.

[32859] VGAM2350 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[32860] An enzyme complex designated DICER COMPLEX, dices the VGAM2350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2350 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2350 RNA is designated SEQ ID:5061, and is provided hereinbelow with reference to the sequence listing part.

[32861] VGAM2350 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32862] VGAM2350 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2350 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32863] The complementary binding of VGAM2350 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2350 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32864] It is appreciated that VGAM2350 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2350 host target genes. The mRNA of each one of this plurality of VGAM2350 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2350 RNA, herein designated VGAM RNA, and which when bound by VGAM2350 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2350 host target proteins.

[32865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2350 gene, herein designated VGAM GENE, on one or more VGAM2350 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32866] It is yet further appreciated that a function of VGAM2350 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2350 correlate with, and may be deduced from, the identity of the host target genes which VGAM2350 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32867] Nucleotide sequences of the VGAM2350 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2350 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2350 are further described hereinbelow with reference to Table 1.

[32868] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2350 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32869] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2351 (VGAM2351) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32870] VGAM2351 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2351 was detected is described hereinabove with reference to Figs. 2-8.

[32871] VGAM2351 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine herpesvirus 2. VGAM2351 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32872] VGAM2351 gene, herein designated VGAM GENE, encodes a VGAM2351 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2351 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2351 precursor RNA is designated SEQ ID:2337, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2337 is located at position 28694 relative to the genome of Equine herpesvirus 2.

[32873] VGAM2351 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32874] An enzyme complex designated DICER COMPLEX, dices the VGAM2351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2351 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2351 RNA is designated SEQ ID:5062, and is provided hereinbelow with reference to the sequence listing part.

[32875] VGAM2351 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32876] VGAM2351 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2351 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32877] The complementary binding of VGAM2351 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2351 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32878] It is appreciated that VGAM2351 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2351 host target genes. The mRNA of each one of this plurality of VGAM2351 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2351 RNA, herein designated VGAM RNA, and which when bound by VGAM2351 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2351 host target proteins.

[32879] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2351 gene, herein designated VGAM GENE, on one or more VGAM2351 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32880] It is yet further appreciated that a function of VGAM2351 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2351 correlate with, and may be deduced from, the identity of the host target genes which VGAM2351 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32881] Nucleotide sequences of the VGAM2351 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2351 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2351 are further described hereinbelow with reference to Table 1.

[32882] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2351 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32883] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2352 (VGAM2352) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32884] VGAM2352 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2352 was detected is described hereinabove with reference to Figs. 2-8.

[32885] VGAM2352 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2352 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32886] VGAM2352 gene, herein designated VGAM GENE, encodes a VGAM2352 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2352 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2352 precursor RNA is designated SEQ ID:2338, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2338 is located at position 8029 relative to the genome of Equine herpesvirus 2.

[32887] VGAM2352 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32888] An enzyme complex designated DICER COMPLEX, dices the VGAM2352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2352 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2352 RNA is designated SEQ ID:5063, and is provided hereinbelow with reference to the sequence listing part.

[32889] VGAM2352 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[32890] VGAM2352 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2352 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32891] The complementary binding of VGAM2352 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2352 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32892] It is appreciated that VGAM2352 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2352 host target genes. The mRNA of each one of this plurality of VGAM2352 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2352 RNA, herein designated VGAM RNA, and which when bound by VGAM2352 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2352 host target proteins.

[32893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2352 gene, herein designated VGAM GENE, on one

or more VGAM2352 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32894] It is yet further appreciated that a function of VGAM2352 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2352 correlate with, and may be deduced from, the identity of the host target genes which VGAM2352 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32895] Nucleotide sequences of the VGAM2352 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2352 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2352 are further described hereinbelow with reference to Table 1.

[32896] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2352 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32897] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2353 (VGAM2353) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32898] VGAM2353 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2353 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[32899] VGAM2353 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2353 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32900] VGAM2353 gene, herein designated VGAM GENE, encodes a VGAM2353 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2353 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2353 precursor RNA is designated SEQ ID:2339, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2339 is located at position 15043 relative to the genome of Equine herpesvirus 2.

[32901] VGAM2353 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32902] An enzyme complex designated DICER COMPLEX, dices the VGAM2353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2353 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM2353 RNA is designated SEQ ID:5064, and is provided hereinbelow with reference to the sequence listing part.

[32903] VGAM2353 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32904] VGAM2353 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2353 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[32905] The complementary binding of VGAM2353 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2353 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32906] It is appreciated that VGAM2353 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2353 host target genes. The mRNA of each one of this plurality of VGAM2353 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2353 RNA, herein designated VGAM RNA, and which when bound by VGAM2353 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2353 host target proteins.

[32907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2353 gene, herein designated VGAM GENE, on one or more VGAM2353 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32908] It is yet further appreciated that a function of VGAM2353 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2353 correlate with, and may be deduced from, the identity of the host target genes which VGAM2353 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[32909] Nucleotide sequences of the VGAM2353 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2353 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2353 are further described hereinbelow with reference to Table 1.

[32910] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2353 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32911] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2354 (VGAM2354) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32912] VGAM2354 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2354 was detected is described hereinabove with reference to Figs. 2-8.

[32913] VGAM2354 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2354 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32914] VGAM2354 gene, herein designated VGAM GENE, encodes a VGAM2354 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2354 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2354 precursor RNA is designated SEQ ID:2340, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2340 is located at position 18623 relative to the genome of Equine herpesvirus 2.

[32915] VGAM2354 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32916] An enzyme complex designated DICER COMPLEX, dices the VGAM2354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2354 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2354 RNA is designated SEQ ID:5065, and is provided hereinbelow with reference to the sequence listing part.

[32917] VGAM2354 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2354 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2354 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32918] VGAM2354 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2354 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2354 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2354 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32919] The complementary binding of VGAM2354 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2354 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2354 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2354 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32920] It is appreciated that VGAM2354 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2354 host target genes. The mRNA of each one of this plurality of VGAM2354 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2354 RNA, herein designated VGAM RNA, and which when bound by VGAM2354 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2354 host target proteins.

[32921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2354 gene, herein designated VGAM GENE, on one or more VGAM2354 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32922] It is yet further appreciated that a function of VGAM2354 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2354 correlate with, and may be deduced from, the identity of the host target genes which VGAM2354 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[32923] Nucleotide sequences of the VGAM2354 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2354 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2354 are further described hereinbelow with reference to Table 1.

[32924] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2354 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32925] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2355 (VGAM2355) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32926] VGAM2355 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2355 was detected is described hereinabove with reference to Figs. 2-8.

[32927] VGAM2355 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2355 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32928] VGAM2355 gene, herein designated VGAM GENE, encodes a VGAM2355 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2355 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2355 precursor RNA is designated SEQ ID:2341, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2341 is located at position 39033 relative to the genome of Equine herpesvirus 2.

[32929] VGAM2355 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32930] An enzyme complex designated DICER COMPLEX, dices the VGAM2355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2355 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2355 RNA is designated SEQ ID:5066, and is provided hereinbelow with reference to the sequence listing part.

[32931] VGAM2355 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32932] VGAM2355 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2355 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32933] The complementary binding of VGAM2355 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2355 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32934] It is appreciated that VGAM2355 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2355 host target genes. The mRNA of each one of this plurality of VGAM2355 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2355 RNA, herein designated VGAM RNA, and which when bound by VGAM2355 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2355 host target proteins.

[32935] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2355 gene, herein designated VGAM GENE, on one or more VGAM2355 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32936] It is yet further appreciated that a function of VGAM2355 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2355 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2355 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32937] Nucleotide sequences of the VGAM2355 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2355 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2355 are further described hereinbelow with reference to Table 1.

[32938] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2355 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32939] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2356 (VGAM2356) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32940] VGAM2356 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2356 was detected is described hereinabove with reference to Figs. 2-8.

[32941] VGAM2356 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2356 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32942] VGAM2356 gene, herein designated VGAM GENE, encodes a VGAM2356 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2356 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2356 precursor RNA is designated SEQ ID:2342, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2342 is located at position 38873 relative to the genome of Equine herpesvirus 2.

[32943] VGAM2356 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2356 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32944] An enzyme complex designated DICER COMPLEX, dices the VGAM2356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2356 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2356 RNA is designated SEQ ID:5067, and is provided hereinbelow with reference to the sequence listing part.

[32945] VGAM2356 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2356 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2356 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32946] VGAM2356 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2356 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2356 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2356 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32947] The complementary binding of VGAM2356 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2356 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2356 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2356 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32948] It is appreciated that VGAM2356 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2356 host target genes. The mRNA of each one of this plurality of VGAM2356 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2356 RNA, herein designated VGAM RNA, and which when bound by VGAM2356 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2356 host target proteins.

[32949] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2356 gene, herein designated VGAM GENE, on one or more VGAM2356 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32950] It is yet further appreciated that a function of VGAM2356 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2356

correlate with, and may be deduced from, the identity of the host target genes which VGAM2356 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32951] Nucleotide sequences of the VGAM2356 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2356 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2356 are further described hereinbelow with reference to Table 1.

[32952] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2356 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32953] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2357 (VGAM2357) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[32954] VGAM2357 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2357 was detected is described hereinabove with reference to Figs. 2-8.

[32955] VGAM2357 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2357 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32956] VGAM2357 gene, herein designated VGAM GENE, encodes a VGAM2357 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2357 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2357 precursor RNA is designated SEQ ID:2343, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2343 is located at position 32894 relative to the genome of Equine herpesvirus 2.

[32957] VGAM2357 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2357 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32958] An enzyme complex designated DICER COMPLEX, dices the VGAM2357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2357 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2357 RNA is designated SEQ ID:5068, and is provided hereinbelow with reference to the sequence listing part.

[32959] VGAM2357 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2357 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2357 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32960] VGAM2357 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2357 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2357 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2357 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2357 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32961] The complementary binding of VGAM2357 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2357 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2357 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2357 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32962] It is appreciated that VGAM2357 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2357 host target genes. The mRNA of each one of this plurality of VGAM2357 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2357 RNA, herein designated VGAM RNA, and which when bound by VGAM2357 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2357 host target proteins.

[32963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2357 gene, herein designated VGAM GENE, on one or more VGAM2357 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32964] It is yet further appreciated that a function of VGAM2357 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2357 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM2357 correlate with, and may be deduced from, the identity of the host target genes which VGAM2357 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32965] Nucleotide sequences of the VGAM2357 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2357 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2357 are further described hereinbelow with reference to Table 1.

[32966] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2357 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32967] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2358 (VGAM2358) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[32968] VGAM2358 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2358 was detected is described hereinabove with reference to Figs. 2-8.

[32969] VGAM2358 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2358 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32970] VGAM2358 gene, herein designated VGAM GENE, encodes a VGAM2358 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2358 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2358 precursor RNA is designated SEQ ID:2344, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2344 is located at position 44667 relative to the genome of Equine herpesvirus 2.

[32971] VGAM2358 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32972] An enzyme complex designated DICER COMPLEX, dices the VGAM2358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2358 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2358 RNA is designated SEQ ID:5069, and is provided hereinbelow with reference to the sequence listing part.

[32973] VGAM2358 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2358 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2358 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32974] VGAM2358 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2358 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2358 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2358 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32975] The complementary binding of VGAM2358 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2358 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2358 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2358 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32976] It is appreciated that VGAM2358 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2358 host target genes. The mRNA of each one of this plurality of VGAM2358 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2358 RNA, herein designated VGAM RNA, and which when bound by VGAM2358 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2358 host target proteins.

[32977] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2358 gene, herein designated VGAM GENE, on one or more VGAM2358 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32978] It is yet further appreciated that a function of VGAM2358 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2358 include diagnosis, prevention and

treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2358 correlate with, and may be deduced from, the identity of the host target genes which VGAM2358 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32979] Nucleotide sequences of the VGAM2358 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2358 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2358 are further described hereinbelow with reference to Table 1.

[32980] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2358 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32981] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2359 (VGAM2359) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32982] VGAM2359 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2359 was detected is described hereinabove with reference to Figs. 2-8.

[32983] VGAM2359 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2359 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32984] VGAM2359 gene, herein designated VGAM GENE, encodes a VGAM2359 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2359 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2359 precursor RNA is designated SEQ ID:2345, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2345 is located at position 34353 relative to the genome of Equine herpesvirus 2.

[32985] VGAM2359 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32986] An enzyme complex designated DICER COMPLEX, dices the VGAM2359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2359 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2359 RNA is designated SEQ ID:5070, and is provided hereinbelow with reference to the sequence listing part.

[32987] VGAM2359 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32988] VGAM2359 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2359 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2359 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32989] The complementary binding of VGAM2359 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2359 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32990] It is appreciated that VGAM2359 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2359 host target genes. The mRNA of each one of this plurality of VGAM2359 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2359 RNA, herein designated VGAM

RNA, and which when bound by VGAM2359 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2359 host target proteins.

[32991] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2359 gene, herein designated VGAM GENE, on one or more VGAM2359 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32992] It is yet further appreciated that a function of VGAM2359 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2359 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2359 correlate with, and may be deduced from, the identity of the host target genes which VGAM2359 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32993] Nucleotide sequences of the VGAM2359 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2359 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2359 are further described hereinbelow with reference to Table 1.

[32994] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2359 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32995] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2360 (VGAM2360) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32996] VGAM2360 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2360 was detected is described hereinabove with reference to Figs. 2-8.

[32997] VGAM2360 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2360 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32998] VGAM2360 gene, herein designated VGAM GENE, encodes a VGAM2360 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2360 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2360 precursor RNA is designated SEQ ID:2346, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2346 is located at position

40669 relative to the genome of Equine herpesvirus 2.

[32999] VGAM2360 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33000] An enzyme complex designated DICER COMPLEX, dices the VGAM2360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2360 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2360 RNA is designated SEQ ID:5071, and is provided hereinbelow with reference to the sequence listing part.

[33001] VGAM2360 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33002] VGAM2360 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2360 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2360 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33003] The complementary binding of VGAM2360 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2360 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33004] It is appreciated that VGAM2360 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2360 host target genes. The mRNA of each one of this plurality of VGAM2360 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2360 RNA, herein designated VGAM RNA, and which when bound by VGAM2360 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2360 host target proteins.

[33005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2360 gene, herein designated VGAM GENE, on one or more VGAM2360 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33006] It is yet further appreciated that a function of VGAM2360 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2360 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2360 correlate with, and may be deduced from, the identity of the host target genes which VGAM2360 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33007] Nucleotide sequences of the VGAM2360 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2360 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2360 are further described hereinbelow with reference to Table 1.

[33008] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2360 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33009] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2361 (VGAM2361) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33010] VGAM2361 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2361 was detected is described hereinabove with reference to Figs. 2-8.

[33011] VGAM2361 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2361 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33012] VGAM2361 gene, herein designated VGAM GENE, encodes a VGAM2361 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2361 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2361 precursor RNA is designated SEQ ID:2347, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2347 is located at position 23557 relative to the genome of Equine herpesvirus 2.

[33013] VGAM2361 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33014] An enzyme complex designated DICER COMPLEX, dices the VGAM2361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2361 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2361 RNA is designated SEQ ID:5072, and is provided hereinbelow with reference to the sequence

listing part.

[33015] VGAM2361 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33016] VGAM2361 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2361 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33017] The complementary binding of VGAM2361 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2361 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33018] It is appreciated that VGAM2361 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2361 host target genes. The mRNA of each one of this plurality of VGAM2361 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2361 RNA, herein designated VGAM RNA, and which when bound by VGAM2361 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2361 host target proteins.

[33019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2361 gene, herein designated VGAM GENE, on one or more VGAM2361 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33020] It is yet further appreciated that a function of VGAM2361

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2361 correlate with, and may be deduced from, the identity of the host target genes which VGAM2361 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33021] Nucleotide sequences of the VGAM2361 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2361 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2361 are further described hereinbelow with reference to Table 1.

[33022] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2361 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33023] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2362 (VGAM2362) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33024] VGAM2362 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2362 was detected is described hereinabove with reference to Figs. 2-8.

[33025] VGAM2362 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2362 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33026] VGAM2362 gene, herein designated VGAM GENE, encodes a VGAM2362 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2362 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2362 precursor RNA is designated SEQ ID:2348, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2348 is located at position 25075 relative to the genome of Equine herpesvirus 2.

[33027] VGAM2362 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33028] An enzyme complex designated DICER COMPLEX, dices the VGAM2362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2362 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2362 RNA is designated SEQ ID:5073, and

is provided hereinbelow with reference to the sequence listing part.

[33029] VGAM2362 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2362 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2362 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33030] VGAM2362 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2362 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2362 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2362 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33031] The complementary binding of VGAM2362 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2362 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2362 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2362 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33032] It is appreciated that VGAM2362 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2362 host target genes. The mRNA of each one of this plurality of VGAM2362 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2362 RNA, herein designated VGAM RNA, and which when bound by VGAM2362 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2362 host target proteins.

[33033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2362 gene, herein designated VGAM GENE, on one or more VGAM2362 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33034] It is yet further appreciated that a function of VGAM2362 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2362 correlate with, and may be deduced from, the identity of the host target genes which VGAM2362 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33035] Nucleotide sequences of the VGAM2362 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2362 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2362 are further described hereinbelow with reference to Table 1.

[33036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2362 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33037] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2363 (VGAM2363) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33038] VGAM2363 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2363 was detected is described hereinabove with reference to Figs. 2-8.

[33039] VGAM2363 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2363 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33040] VGAM2363 gene, herein designated VGAM GENE, encodes a VGAM2363 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2363 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2363 precur-

sor RNA is designated SEQ ID:2349, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2349 is located at position 40183 relative to the genome of Equine herpesvirus 2.

[33041] VGAM2363 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33042] An enzyme complex designated DICER COMPLEX, dices the VGAM2363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2363 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2363 RNA is designated SEQ ID:5074, and is provided hereinbelow with reference to the sequence listing part.

[33043] VGAM2363 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33044] VGAM2363 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2363 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2363 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33045] The complementary binding of VGAM2363 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2363 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33046] It is appreciated that VGAM2363 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2363 host target genes. The mRNA of

each one of this plurality of VGAM2363 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2363 RNA, herein designated VGAM RNA, and which when bound by VGAM2363 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2363 host target proteins.

[33047] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2363 gene, herein designated VGAM GENE, on one or more VGAM2363 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[33048] It is yet further appreciated that a function of VGAM2363 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2363 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2363 correlate with, and may be deduced from, the identity of the host target genes which VGAM2363 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33049] Nucleotide sequences of the VGAM2363 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2363 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2363 are further described hereinbelow with reference to Table 1.

[33050] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2363 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[33051] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2364 (VGAM2364) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33052] VGAM2364 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2364 was detected is described hereinabove with reference to Figs. 2-8.

[33053] VGAM2364 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2364 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33054] VGAM2364 gene, herein designated VGAM GENE, encodes a VGAM2364 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2364 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2364 precursor RNA is designated SEQ ID:2350, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2350 is located at position 23189 relative to the genome of Equine herpesvirus 2.

[33055] VGAM2364 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33056] An enzyme complex designated DICER COMPLEX, dices the VGAM2364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2364 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 64%) nucleotide sequence of VGAM2364 RNA is designated SEQ ID:5075, and is provided hereinbelow with reference to the sequence listing part.

[33057] VGAM2364 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33058] VGAM2364 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2364 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33059] The complementary binding of VGAM2364 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2364 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33060] It is appreciated that VGAM2364 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2364 host target genes. The mRNA of each one of this plurality of VGAM2364 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2364 RNA, herein designated VGAM RNA, and which when bound by VGAM2364 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2364 host target proteins.

[33061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2364 gene, herein designated VGAM GENE, on one or more VGAM2364 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33062] It is yet further appreciated that a function of VGAM2364 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2364 correlate with, and may be deduced from, the identity of the host target genes which VGAM2364 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33063] Nucleotide sequences of the VGAM2364 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2364 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2364 are further described hereinbelow with reference to Table 1.

[33064] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2364 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33065] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2365 (VGAM2365) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33066] VGAM2365 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2365 was detected is described hereinabove with reference to Figs. 2-8.

[33067] VGAM2365 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2365 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33068] VGAM2365 gene, herein designated VGAM GENE, encodes a VGAM2365 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2365 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2365 precursor RNA is designated SEQ ID:2351, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2351 is located at position 185947 relative to the genome of Rat cytomegalovirus.

[33069] VGAM2365 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33070] An enzyme complex designated DICER COMPLEX, dices the VGAM2365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2365 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2365 RNA is designated SEQ ID:5076, and is provided hereinbelow with reference to the sequence listing part.

[33071] VGAM2365 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2365 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2365 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33072] VGAM2365 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2365 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2365 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2365 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33073] The complementary binding of VGAM2365 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2365 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2365 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2365 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33074] It is appreciated that VGAM2365 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2365 host target genes. The mRNA of each one of this plurality of VGAM2365 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2365 RNA, herein designated VGAM RNA, and which when bound by VGAM2365 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2365 host target proteins.

[33075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2365 gene, herein designated VGAM GENE, on one or more VGAM2365 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33076] It is yet further appreciated that a function of VGAM2365 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2365 correlate with, and may be deduced from, the identity of the host target genes which VGAM2365 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33077] Nucleotide sequences of the VGAM2365 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2365 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2365 are further described hereinbelow with reference to Table 1.

[33078] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2365 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33079] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2366 (VGAM2366) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33080] VGAM2366 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2366 was detected is described hereinabove with reference to Figs. 2-8.

[33081] VGAM2366 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2366 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33082] VGAM2366 gene, herein designated VGAM GENE, encodes a VGAM2366 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2366 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2366 precursor RNA is designated SEQ ID:2352, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2352 is located at position 183326 relative to the genome of Rat cytomegalovirus.

[33083] VGAM2366 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33084] An enzyme complex designated DICER COMPLEX, dices the VGAM2366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2366 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2366 RNA is designated SEQ ID:5077, and is provided hereinbelow with reference to the sequence listing part.

[33085] VGAM2366 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33086] VGAM2366 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2366 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33087] The complementary binding of VGAM2366 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2366 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33088] It is appreciated that VGAM2366 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2366 host target genes. The mRNA of each one of this plurality of VGAM2366 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2366 RNA, herein designated VGAM RNA, and which when bound by VGAM2366 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2366 host target proteins.

[33089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2366 gene, herein designated VGAM GENE, on one or more VGAM2366 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33090] It is yet further appreciated that a function of VGAM2366 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2366 correlate with, and may be deduced from, the identity of the host target genes which VGAM2366 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33091] Nucleotide sequences of the VGAM2366 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2366 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2366 are further described hereinbelow with reference to Table 1.

[33092] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2366 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33093] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2367 (VGAM2367) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33094] VGAM2367 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2367 was detected is described hereinabove with reference to Figs. 2-8.

[33095] VGAM2367 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2367 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33096] VGAM2367 gene, herein designated VGAM GENE, encodes a VGAM2367 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2367 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2367 precursor RNA is designated SEQ ID:2353, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2353 is located at position 207957 relative to the genome of Rat cytomegalovirus.

[33097] VGAM2367 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33098] An enzyme complex designated DICER COMPLEX, dices the VGAM2367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2367 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2367 RNA is designated SEQ ID:5078, and is provided hereinbelow with reference to the sequence listing part.

[33099] VGAM2367 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33100] VGAM2367 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2367 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2367 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33101] The complementary binding of VGAM2367 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2367 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[33102] It is appreciated that VGAM2367 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2367 host target genes. The mRNA of each one of this plurality of VGAM2367 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2367 RNA, herein designated VGAM RNA, and which when bound by VGAM2367 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2367 host target proteins.

[33103] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2367 gene, herein designated VGAM GENE, on one or more VGAM2367 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33104] It is yet further appreciated that a function of VGAM2367 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2367 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2367 correlate with, and may be deduced from, the identity of the host target genes which VGAM2367 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33105] Nucleotide sequences of the VGAM2367 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2367 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2367 are further described hereinbelow with reference to Table 1.

[33106] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2367 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33107] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2368 (VGAM2368) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33108] VGAM2368 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2368 was detected is described hereinabove with reference to Figs. 2-8.

[33109] VGAM2368 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2368 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33110] VGAM2368 gene, herein designated VGAM GENE, encodes a VGAM2368 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2368 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2368 precursor RNA is designated SEQ ID:2354, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2354 is located at position 223088 relative to the genome of Rat cytomegalovirus.

[33111] VGAM2368 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33112] An enzyme complex designated DICER COMPLEX, dices the VGAM2368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2368 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2368 RNA is designated SEQ ID:5079, and is provided hereinbelow with reference to the sequence listing part.

[33113] VGAM2368 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33114] VGAM2368 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2368 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2368 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33115] The complementary binding of VGAM2368 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2368 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33116] It is appreciated that VGAM2368 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2368 host target genes. The mRNA of each one of this plurality of VGAM2368 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2368 RNA, herein designated VGAM RNA, and which when bound by VGAM2368 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2368 host target proteins.

[33117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2368 gene, herein designated VGAM GENE, on one or more VGAM2368 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33118] It is yet further appreciated that a function of VGAM2368 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2368 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2368 correlate with, and may be deduced from, the identity of the host target genes which VGAM2368 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33119] Nucleotide sequences of the VGAM2368 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2368 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2368 are further described hereinbelow with reference to Table 1.

[33120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2368 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33121] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2369 (VGAM2369) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33122] VGAM2369 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2369 was detected is described hereinabove with reference to Figs. 2-8.

[33123] VGAM2369 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2369 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33124] VGAM2369 gene, herein designated VGAM GENE, encodes

a VGAM2369 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2369 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2369 precursor RNA is designated SEQ ID:2355, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2355 is located at position 208920 relative to the genome of Rat cytomegalovirus.

[33125] VGAM2369 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33126] An enzyme complex designated DICER COMPLEX, dices the VGAM2369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2369 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2369 RNA is designated SEQ ID:5080, and is provided hereinbelow with reference to the sequence listing part.

[33127] VGAM2369 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2369 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2369 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33128] VGAM2369 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2369 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2369 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2369 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33129] The complementary binding of VGAM2369 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2369 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2369 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2369 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33130] It is appreciated that VGAM2369 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2369 host target genes. The mRNA of each one of this plurality of VGAM2369 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2369 RNA, herein designated VGAM RNA, and which when bound by VGAM2369 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2369 host target proteins.

[33131] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2369 gene, herein designated VGAM GENE, on one or more VGAM2369 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33132] It is yet further appreciated that a function of VGAM2369 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2369 correlate with, and may be deduced from, the identity of the host target genes which VGAM2369 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33133] Nucleotide sequences of the VGAM2369 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2369 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2369 are further

described hereinbelow with reference to Table 1.

[33134] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2369 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33135] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2370 (VGAM2370) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33136] VGAM2370 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2370 was detected is described hereinabove with reference to Figs. 2-8.

[33137] VGAM2370 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2370 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33138] VGAM2370 gene, herein designated VGAM GENE, encodes a VGAM2370 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2370 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2370 precursor RNA is designated SEQ ID:2356, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2356 is located at position 217655 relative to the genome of Rat cytomegalovirus.

[33139] VGAM2370 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33140] An enzyme complex designated DICER COMPLEX, dices the VGAM2370 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2370 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2370 RNA is designated SEQ ID:5081, and is provided hereinbelow with reference to the sequence listing part.

[33141] VGAM2370 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2370 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2370 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33142] VGAM2370 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2370 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2370 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2370 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2370 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33143] The complementary binding of VGAM2370 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2370 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2370

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2370 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33144] It is appreciated that VGAM2370 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2370 host target genes. The mRNA of each one of this plurality of VGAM2370 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2370 RNA, herein designated VGAM RNA, and which when bound by VGAM2370 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2370 host target proteins.

[33145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2370 gene, herein designated VGAM GENE, on one or more VGAM2370 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33146] It is yet further appreciated that a function of VGAM2370 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2370 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2370 correlate with, and may be deduced from, the identity of the host target genes which VGAM2370 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33147] Nucleotide sequences of the VGAM2370 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2370 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2370 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2370 are further described hereinbelow with reference to Table 1.

[33148] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2370 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33149] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2371 (VGAM2371) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33150] VGAM2371 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2371 was detected is described hereinabove with reference to Figs. 2-8.

[33151] VGAM2371 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2371 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[33152] VGAM2371 gene, herein designated VGAM GENE, encodes a VGAM2371 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2371 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2371 precursor RNA is designated SEQ ID:2357, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2357 is located at position 183987 relative to the genome of Rat cytomegalovirus.

[33153] VGAM2371 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33154] An enzyme complex designated DICER COMPLEX, dices

the VGAM2371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2371 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM2371 RNA is designated SEQ ID:5082, and is provided hereinbelow with reference to the sequence listing part.

[33155] VGAM2371 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2371 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2371 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33156] VGAM2371 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2371 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2371 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2371 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2371 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33157] The complementary binding of VGAM2371 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2371 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2371 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2371 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33158] It is appreciated that VGAM2371 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2371 host target genes. The mRNA of each one of this plurality of VGAM2371 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2371 RNA, herein designated VGAM RNA, and which when bound by VGAM2371 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2371 host target proteins.

[33159] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2371 gene, herein designated VGAM GENE, on one or more VGAM2371 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33160] It is yet further appreciated that a function of VGAM2371 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2371 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2371 correlate with, and may be deduced from, the identity of the host target genes which VGAM2371 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33161] Nucleotide sequences of the VGAM2371 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2371 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2371 are further described hereinbelow with reference to Table 1.

[33162] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2371 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33163] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2372 (VGAM2372) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33164] VGAM2372 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2372 was detected is described hereinabove with reference to Figs. 2-8.

[33165] VGAM2372 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2372 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[33166] VGAM2372 gene, herein designated VGAM GENE, encodes a VGAM2372 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2372 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2372 precursor RNA is designated SEQ ID:2358, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2358 is located at position 208652 relative to the genome of Rat cytomegalovirus.

[33167] VGAM2372 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33168] An enzyme complex designated DICER COMPLEX, dices the VGAM2372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2372 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2372 RNA is designated SEQ ID:5083, and is provided hereinbelow with reference to the sequence listing part.

[33169] VGAM2372 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2372 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2372 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33170] VGAM2372 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2372 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2372 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2372 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2372 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33171] The complementary binding of VGAM2372 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2372 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2372 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2372 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33172] It is appreciated that VGAM2372 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2372 host target genes. The mRNA of each one of this plurality of VGAM2372 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2372 RNA, herein designated VGAM RNA, and which when bound by VGAM2372 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2372 host target proteins.

[33173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2372 gene, herein designated VGAM GENE, on one or more VGAM2372 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33174] It is yet further appreciated that a function of VGAM2372 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2372 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2372 correlate with, and may be deduced from, the identity of the host target genes which VGAM2372 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33175] Nucleotide sequences of the VGAM2372 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2372 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2372 are further described hereinbelow with reference to Table 1.

[33176] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2372 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33177] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2373 (VGAM2373) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33178] VGAM2373 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2373 was detected is described hereinabove with reference to Figs. 2-8.

[33179] VGAM2373 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus.

VGAM2373 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33180] VGAM2373 gene, herein designated VGAM GENE, encodes a VGAM2373 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2373 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2373 precursor RNA is designated SEQ ID:2359, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2359 is located at position 222910 relative to the genome of Rat cytomegalovirus.

[33181] VGAM2373 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[33182] An enzyme complex designated DICER COMPLEX, dices the VGAM2373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2373 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2373 RNA is designated SEQ ID:5084, and is provided hereinbelow with reference to the sequence listing part.

[33183] VGAM2373 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2373 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2373 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33184] VGAM2373 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2373 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2373 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2373 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2373 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33185] The complementary binding of VGAM2373 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2373 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2373 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2373 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33186] It is appreciated that VGAM2373 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2373 host target genes. The mRNA of each one of this plurality of VGAM2373 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2373 RNA, herein designated VGAM RNA, and which when bound by VGAM2373 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2373 host target proteins.

[33187] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2373 gene, herein designated VGAM GENE, on one or more VGAM2373 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33188] It is yet further appreciated that a function of VGAM2373 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2373 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2373 correlate with, and may be deduced from, the identity of the host target genes which VGAM2373 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33189] Nucleotide sequences of the VGAM2373 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2373 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2373 are further described hereinbelow with reference to Table 1.

[33190] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2373 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33191] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2374 (VGAM2374) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33192] VGAM2374 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2374 was detected is described hereinabove with reference to Figs. 2-8.

[33193] VGAM2374 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Rat cytomegalovirus. VGAM2374 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33194] VGAM2374 gene, herein designated VGAM GENE, encodes a VGAM2374 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2374 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2374 precursor RNA is designated SEQ ID:2360, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2360 is located at position 203878 relative to the genome of Rat cytomegalovirus.

[33195] VGAM2374 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33196] An enzyme complex designated DICER COMPLEX, dices the VGAM2374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2374 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM2374 RNA is designated SEQ ID:5085, and is provided hereinbelow with reference to the sequence listing part.

[33197] VGAM2374 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33198] VGAM2374 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2374 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33199] The complementary binding of VGAM2374 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2374 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33200] It is appreciated that VGAM2374 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2374 host target genes. The mRNA of each one of this plurality of VGAM2374 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2374 RNA, herein designated VGAM RNA, and which when bound by VGAM2374 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2374 host target proteins.

[33201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2374 gene, herein designated VGAM GENE, on one or more VGAM2374 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33202] It is yet further appreciated that a function of VGAM2374 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2374 correlate with, and may be deduced from, the identity of the host target genes which VGAM2374 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33203] Nucleotide sequences of the VGAM2374 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2374 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2374 are further described hereinbelow with reference to Table 1.

[33204] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2374 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33205] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2375 (VGAM2375) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33206] VGAM2375 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2375 was detected is described hereinabove with reference to Figs. 2-8.

[33207] VGAM2375 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2375 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33208] VGAM2375 gene, herein designated VGAM GENE, encodes a VGAM2375 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2375 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2375 precursor RNA is designated SEQ ID:2361, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2361 is located at position 217137 relative to the genome of Rat cytomegalovirus.

[33209] VGAM2375 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33210] An enzyme complex designated DICER COMPLEX, dices the VGAM2375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2375 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2375 RNA is designated SEQ ID:5086, and is provided hereinbelow with reference to the sequence listing part.

[33211] VGAM2375 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[33212] VGAM2375 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2375 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2375 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33213] The complementary binding of VGAM2375 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2375 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33214] It is appreciated that VGAM2375 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2375 host target genes. The mRNA of each one of this plurality of VGAM2375 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2375 RNA, herein designated VGAM RNA, and which when bound by VGAM2375 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2375 host target proteins.

[33215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2375 gene, herein designated VGAM GENE, on one

or more VGAM2375 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33216] It is yet further appreciated that a function of VGAM2375 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2375 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2375 correlate with, and may be deduced from, the identity of the host target genes which VGAM2375 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33217] Nucleotide sequences of the VGAM2375 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2375 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2375 are further described hereinbelow with reference to Table 1.

[33218] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2375 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33219] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2376 (VGAM2376) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33220] VGAM2376 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2376 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[33221] VGAM2376 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2376 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33222] VGAM2376 gene, herein designated VGAM GENE, encodes a VGAM2376 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2376 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2376 precursor RNA is designated SEQ ID:2362, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2362 is located at position 188783 relative to the genome of Rat cytomegalovirus.

[33223] VGAM2376 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33224] An enzyme complex designated DICER COMPLEX, dices the VGAM2376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2376 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2376 RNA is designated SEQ ID:5087, and is provided hereinbelow with reference to the sequence listing part.

[33225] VGAM2376 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33226] VGAM2376 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2376 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2376 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[33227] The complementary binding of VGAM2376 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2376 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33228] It is appreciated that VGAM2376 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2376 host target genes. The mRNA of each one of this plurality of VGAM2376 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2376 RNA, herein designated VGAM RNA, and which when bound by VGAM2376 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2376 host target proteins.

[33229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2376 gene, herein designated VGAM GENE, on one or more VGAM2376 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33230] It is yet further appreciated that a function of VGAM2376 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2376 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2376 correlate with, and may be deduced from, the identity of the host target genes which VGAM2376 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[33231] Nucleotide sequences of the VGAM2376 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2376 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2376 are further described hereinbelow with reference to Table 1.

[33232] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2376 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33233] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2377 (VGAM2377) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33234] VGAM2377 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2377 was detected is described hereinabove with reference to Figs. 2-8.

[33235] VGAM2377 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2377 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33236] VGAM2377 gene, herein designated VGAM GENE, encodes a VGAM2377 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2377 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2377 precursor RNA is designated SEQ ID:2363, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2363 is located at position 197566 relative to the genome of Rat cytomegalovirus.

[33237] VGAM2377 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33238] An enzyme complex designated DICER COMPLEX, dices the VGAM2377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2377 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2377 RNA is designated SEQ ID:5088, and is provided hereinbelow with reference to the sequence listing part.

[33239] VGAM2377 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33240] VGAM2377 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2377 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2377 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33241] The complementary binding of VGAM2377 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2377 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33242] It is appreciated that VGAM2377 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2377 host target genes. The mRNA of each one of this plurality of VGAM2377 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2377 RNA, herein designated VGAM RNA, and which when bound by VGAM2377 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2377 host target proteins.

[33243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2377 gene, herein designated VGAM GENE, on one or more VGAM2377 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33244] It is yet further appreciated that a function of VGAM2377 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2377 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2377 correlate with, and may be deduced from, the identity of the host target genes which VGAM2377 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[33245] Nucleotide sequences of the VGAM2377 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2377 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2377 are further described hereinbelow with reference to Table 1.

[33246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2377 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33247] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2378 (VGAM2378) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33248] VGAM2378 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2378 was detected is described hereinabove with reference to Figs. 2-8.

[33249] VGAM2378 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2378 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33250] VGAM2378 gene, herein designated VGAM GENE, encodes a VGAM2378 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2378 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2378 precursor RNA is designated SEQ ID:2364, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2364 is located at position 219131 relative to the genome of Rat cytomegalovirus.

[33251] VGAM2378 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33252] An enzyme complex designated DICER COMPLEX, dices the VGAM2378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2378 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2378 RNA is designated SEQ ID:5089, and is provided hereinbelow with reference to the sequence listing part.

[33253] VGAM2378 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33254] VGAM2378 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2378 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2378 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33255] The complementary binding of VGAM2378 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2378 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33256] It is appreciated that VGAM2378 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2378 host target genes. The mRNA of each one of this plurality of VGAM2378 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2378 RNA, herein designated VGAM RNA, and which when bound by VGAM2378 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2378 host target proteins.

[33257] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2378 gene, herein designated VGAM GENE, on one or more VGAM2378 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33258] It is yet further appreciated that a function of VGAM2378 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2378 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2378 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2378 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33259] Nucleotide sequences of the VGAM2378 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2378 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2378 are further described hereinbelow with reference to Table 1.

[33260] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2378 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33261] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2379 (VGAM2379) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33262] VGAM2379 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2379 was detected is described hereinabove with reference to Figs. 2-8.

[33263] VGAM2379 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2379 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33264] VGAM2379 gene, herein designated VGAM GENE, encodes a VGAM2379 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2379 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2379 precursor RNA is designated SEQ ID:2365, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2365 is located at position 212075 relative to the genome of Rat cytomegalovirus.

[33265] VGAM2379 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2379 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33266] An enzyme complex designated DICER COMPLEX, dices the VGAM2379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2379 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM2379 RNA is designated SEQ ID:5090, and is provided hereinbelow with reference to the sequence listing part.

[33267] VGAM2379 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2379 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2379 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33268] VGAM2379 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2379 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2379 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2379 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33269] The complementary binding of VGAM2379 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2379 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2379 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2379 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33270] It is appreciated that VGAM2379 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2379 host target genes. The mRNA of each one of this plurality of VGAM2379 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2379 RNA, herein designated VGAM RNA, and which when bound by VGAM2379 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2379 host target proteins.

[33271] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2379 gene, herein designated VGAM GENE, on one or more VGAM2379 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33272] It is yet further appreciated that a function of VGAM2379 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2379

correlate with, and may be deduced from, the identity of the host target genes which VGAM2379 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33273] Nucleotide sequences of the VGAM2379 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2379 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2379 are further described hereinbelow with reference to Table 1.

[33274] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2379 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33275] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2380 (VGAM2380) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[33276] VGAM2380 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2380 was detected is described hereinabove with reference to Figs. 2-8.

[33277] VGAM2380 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2380 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33278] VGAM2380 gene, herein designated VGAM GENE, encodes a VGAM2380 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2380 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2380 precursor RNA is designated SEQ ID:2366, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2366 is located at position 7588 relative to the genome of Human herpesvirus 4.

[33279] VGAM2380 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2380 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33280] An enzyme complex designated DICER COMPLEX, dices the VGAM2380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2380 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM2380 RNA is designated SEQ ID:5091, and is provided hereinbelow with reference to the sequence listing part.

[33281] VGAM2380 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2380 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2380 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33282] VGAM2380 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2380 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2380 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2380 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2380 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33283] The complementary binding of VGAM2380 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2380 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2380 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2380 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33284] It is appreciated that VGAM2380 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2380 host target genes. The mRNA of each one of this plurality of VGAM2380 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2380 RNA, herein designated VGAM RNA, and which when bound by VGAM2380 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2380 host target proteins.

[33285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2380 gene, herein designated VGAM GENE, on one or more VGAM2380 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33286] It is yet further appreciated that a function of VGAM2380 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2380 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM2380 correlate with, and may be deduced from, the identity of the host target genes which VGAM2380 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33287] Nucleotide sequences of the VGAM2380 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2380 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2380 are further described hereinbelow with reference to Table 1.

[33288] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2380 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33289] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2381 (VGAM2381) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[33290] VGAM2381 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2381 was detected is described hereinabove with reference to Figs. 2-8.

[33291] VGAM2381 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2381 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33292] VGAM2381 gene, herein designated VGAM GENE, encodes a VGAM2381 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2381 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2381 precursor RNA is designated SEQ ID:2367, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2367 is located at position 48597 relative to the genome of Human herpesvirus 4.

[33293] VGAM2381 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33294] An enzyme complex designated DICER COMPLEX, dices the VGAM2381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2381 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM2381 RNA is designated SEQ ID:5092, and is provided hereinbelow with reference to the sequence listing part.

[33295] VGAM2381 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2381 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2381 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33296] VGAM2381 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2381 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2381 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2381 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2381 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33297] The complementary binding of VGAM2381 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2381 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2381 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2381 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33298] It is appreciated that VGAM2381 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2381 host target genes. The mRNA of each one of this plurality of VGAM2381 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2381 RNA, herein designated VGAM RNA, and which when bound by VGAM2381 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2381 host target proteins.

[33299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2381 gene, herein designated VGAM GENE, on one or more VGAM2381 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33300] It is yet further appreciated that a function of VGAM2381 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2381 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2381 correlate with, and may be deduced from, the identity of the host target genes which VGAM2381 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33301] Nucleotide sequences of the VGAM2381 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2381 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2381 are further described hereinbelow with reference to Table 1.

[33302] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2381 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33303] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2382 (VGAM2382) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33304] VGAM2382 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2382 was detected is described hereinabove with reference to Figs. 2-8.

[33305] VGAM2382 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2382 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33306] VGAM2382 gene, herein designated VGAM GENE, encodes a VGAM2382 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2382 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2382 precursor RNA is designated SEQ ID:2368, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2368 is located at position 54739 relative to the genome of Human herpesvirus 4.

[33307] VGAM2382 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33308] An enzyme complex designated DICER COMPLEX, dices the VGAM2382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2382 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2382 RNA is designated SEQ ID:5093, and is provided hereinbelow with reference to the sequence listing part.

[33309] VGAM2382 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33310] VGAM2382 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2382 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2382 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33311] The complementary binding of VGAM2382 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2382 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33312] It is appreciated that VGAM2382 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2382 host target genes. The mRNA of each one of this plurality of VGAM2382 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2382 RNA, herein designated VGAM

RNA, and which when bound by VGAM2382 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2382 host target proteins.

[33313] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2382 gene, herein designated VGAM GENE, on one or more VGAM2382 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33314] It is yet further appreciated that a function of VGAM2382 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2382 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2382 correlate with, and may be deduced from, the identity of the host target genes which VGAM2382 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33315] Nucleotide sequences of the VGAM2382 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2382 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2382 are further described hereinbelow with reference to Table 1.

[33316] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2382 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33317] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2383 (VGAM2383) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33318] VGAM2383 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2383 was detected is described hereinabove with reference to Figs. 2-8.

[33319] VGAM2383 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2383 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33320] VGAM2383 gene, herein designated VGAM GENE, encodes a VGAM2383 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2383 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2383 precursor RNA is designated SEQ ID:2369, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2369 is located at position

53736 relative to the genome of Human herpesvirus 4.

[33321] VGAM2383 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33322] An enzyme complex designated DICER COMPLEX, dices the VGAM2383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2383 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2383 RNA is designated SEQ ID:5094, and is provided hereinbelow with reference to the sequence listing part.

[33323] VGAM2383 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33324] VGAM2383 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2383 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2383 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33325] The complementary binding of VGAM2383 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2383 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33326] It is appreciated that VGAM2383 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2383 host target genes. The mRNA of each one of this plurality of VGAM2383 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2383 RNA, herein designated VGAM RNA, and which when bound by VGAM2383 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2383 host target proteins.

[33327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2383 gene, herein designated VGAM GENE, on one or more VGAM2383 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33328] It is yet further appreciated that a function of VGAM2383 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2383 correlate with, and may be deduced from, the identity of the host target genes which VGAM2383 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33329] Nucleotide sequences of the VGAM2383 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2383 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2383 are further described hereinbelow with reference to Table 1.

[33330] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2383 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33331] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2384 (VGAM2384) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33332] VGAM2384 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2384 was detected is described hereinabove with reference to Figs. 2-8.

[33333] VGAM2384 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2384 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33334] VGAM2384 gene, herein designated VGAM GENE, encodes a VGAM2384 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2384 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2384 precursor RNA is designated SEQ ID:2370, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2370 is located at position 5198 relative to the genome of Human herpesvirus 4.

[33335] VGAM2384 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33336] An enzyme complex designated DICER COMPLEX, dices the VGAM2384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2384 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2384 RNA is designated SEQ ID:5095, and is provided hereinbelow with reference to the sequence

listing part.

[33337] VGAM2384 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33338] VGAM2384 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2384 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2384 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33339] The complementary binding of VGAM2384 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2384 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33340] It is appreciated that VGAM2384 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2384 host target genes. The mRNA of each one of this plurality of VGAM2384 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2384 RNA, herein designated VGAM RNA, and which when bound by VGAM2384 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2384 host target proteins.

[33341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2384 gene, herein designated VGAM GENE, on one or more VGAM2384 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33342] It is yet further appreciated that a function of VGAM2384

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2384 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2384 correlate with, and may be deduced from, the identity of the host target genes which VGAM2384 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33343] Nucleotide sequences of the VGAM2384 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2384 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2384 are further described hereinbelow with reference to Table 1.

[33344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2384 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33345] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2385 (VGAM2385) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33346] VGAM2385 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2385 was detected is described hereinabove with reference to Figs. 2-8.

[33347] VGAM2385 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2385 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33348] VGAM2385 gene, herein designated VGAM GENE, encodes a VGAM2385 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2385 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2385 precursor RNA is designated SEQ ID:2371, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2371 is located at position 7899 relative to the genome of Human herpesvirus 4.

[33349] VGAM2385 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33350] An enzyme complex designated DICER COMPLEX, dices the VGAM2385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2385 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM2385 RNA is designated SEQ ID:5096, and

is provided hereinbelow with reference to the sequence listing part.

[33351] VGAM2385 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33352] VGAM2385 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2385 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2385 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33353] The complementary binding of VGAM2385 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2385 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33354] It is appreciated that VGAM2385 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2385 host target genes. The mRNA of each one of this plurality of VGAM2385 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2385 RNA, herein designated VGAM RNA, and which when bound by VGAM2385 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2385 host target proteins.

[33355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2385 gene, herein designated VGAM GENE, on one or more VGAM2385 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33356] It is yet further appreciated that a function of VGAM2385 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2385 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2385 correlate with, and may be deduced from, the identity of the host target genes which VGAM2385 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33357] Nucleotide sequences of the VGAM2385 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2385 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2385 are further described hereinbelow with reference to Table 1.

[33358] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2385 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33359] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2386 (VGAM2386) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33360] VGAM2386 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2386 was detected is described hereinabove with reference to Figs. 2-8.

[33361] VGAM2386 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2386 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33362] VGAM2386 gene, herein designated VGAM GENE, encodes a VGAM2386 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2386 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2386 precur-

sor RNA is designated SEQ ID:2372, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2372 is located at position 6848 relative to the genome of Human herpesvirus 4.

[33363] VGAM2386 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33364] An enzyme complex designated DICER COMPLEX, dices the VGAM2386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2386 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2386 RNA is designated SEQ ID:5097, and is provided hereinbelow with reference to the sequence listing part.

[33365] VGAM2386 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33366] VGAM2386 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2386 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2386 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33367] The complementary binding of VGAM2386 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2386 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33368] It is appreciated that VGAM2386 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2386 host target genes. The mRNA of

each one of this plurality of VGAM2386 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2386 RNA, herein designated VGAM RNA, and which when bound by VGAM2386 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2386 host target proteins.

[33369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2386 gene, herein designated VGAM GENE, on one or more VGAM2386 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[33370] It is yet further appreciated that a function of VGAM2386 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2386 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2386 correlate with, and may be deduced from, the identity of the host target genes which VGAM2386 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33371] Nucleotide sequences of the VGAM2386 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2386 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2386 are further described hereinbelow with reference to Table 1.

[33372] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2386 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[33373] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2387 (VGAM2387) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33374] VGAM2387 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2387 was detected is described hereinabove with reference to Figs. 2-8.

[33375] VGAM2387 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2387 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33376] VGAM2387 gene, herein designated VGAM GENE, encodes a VGAM2387 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2387 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2387 precursor RNA is designated SEQ ID:2373, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2373 is located at position 7029 relative to the genome of Human herpesvirus 4.

[33377] VGAM2387 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33378] An enzyme complex designated DICER COMPLEX, dices the VGAM2387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2387 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2387 RNA is designated SEQ ID:5098, and is provided hereinbelow with reference to the sequence listing part.

[33379] VGAM2387 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33380] VGAM2387 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2387 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33381] The complementary binding of VGAM2387 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2387 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33382] It is appreciated that VGAM2387 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2387 host target genes. The mRNA of each one of this plurality of VGAM2387 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2387 RNA, herein designated VGAM RNA, and which when bound by VGAM2387 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2387 host target proteins.

[33383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2387 gene, herein designated VGAM GENE, on one or more VGAM2387 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33384] It is yet further appreciated that a function of VGAM2387 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2387 correlate with, and may be deduced from, the identity of the host target genes which VGAM2387 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33385] Nucleotide sequences of the VGAM2387 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2387 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2387 are further described hereinbelow with reference to Table 1.

[33386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2387 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33387] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2388 (VGAM2388) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33388] VGAM2388 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2388 was detected is described hereinabove with reference to Figs. 2-8.

[33389] VGAM2388 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2388 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33390] VGAM2388 gene, herein designated VGAM GENE, encodes a VGAM2388 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2388 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2388 precursor RNA is designated SEQ ID:2374, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2374 is located at position 55246 relative to the genome of Human herpesvirus 4.

[33391] VGAM2388 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33392] An enzyme complex designated DICER COMPLEX, dices the VGAM2388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2388 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2388 RNA is designated SEQ ID:5099, and is provided hereinbelow with reference to the sequence listing part.

[33393] VGAM2388 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33394] VGAM2388 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2388 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2388 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33395] The complementary binding of VGAM2388 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2388 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33396] It is appreciated that VGAM2388 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2388 host target genes. The mRNA of each one of this plurality of VGAM2388 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2388 RNA, herein designated VGAM RNA, and which when bound by VGAM2388 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2388 host target proteins.

[33397] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2388 gene, herein designated VGAM GENE, on one or more VGAM2388 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33398] It is yet further appreciated that a function of VGAM2388 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2388 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2388 correlate with, and may be deduced from, the identity of the host target genes which VGAM2388 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33399] Nucleotide sequences of the VGAM2388 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2388 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2388 are further described hereinbelow with reference to Table 1.

[33400] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2388 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33401] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2389 (VGAM2389) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33402] VGAM2389 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2389 was detected is described hereinabove with reference to Figs. 2-8.

[33403] VGAM2389 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2389 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33404] VGAM2389 gene, herein designated VGAM GENE, encodes a VGAM2389 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2389 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2389 precursor RNA is designated SEQ ID:2375, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2375 is located at position 19516 relative to the genome of Goatpox virus.

[33405] VGAM2389 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33406] An enzyme complex designated DICER COMPLEX, dices the VGAM2389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2389 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2389 RNA is designated SEQ ID:5100, and is provided hereinbelow with reference to the sequence listing part.

[33407] VGAM2389 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33408] VGAM2389 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2389 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33409] The complementary binding of VGAM2389 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2389 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33410] It is appreciated that VGAM2389 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2389 host target genes. The mRNA of each one of this plurality of VGAM2389 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2389 RNA, herein designated VGAM RNA, and which when bound by VGAM2389 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2389 host target proteins.

[33411] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2389 gene, herein designated VGAM GENE, on one or more VGAM2389 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33412] It is yet further appreciated that a function of VGAM2389 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2389 correlate with, and may be deduced from, the identity of the host target genes which VGAM2389 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33413] Nucleotide sequences of the VGAM2389 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2389 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2389 are further described hereinbelow with reference to Table 1.

[33414] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2389 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33415] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2390 (VGAM2390) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33416] VGAM2390 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2390 was detected is described hereinabove with reference to Figs. 2-8.

[33417] VGAM2390 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2390 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33418] VGAM2390 gene, herein designated VGAM GENE, encodes a VGAM2390 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2390 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2390 precursor RNA is designated SEQ ID:2376, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2376 is located at position 85371 relative to the genome of Goatpox virus.

[33419] VGAM2390 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33420] An enzyme complex designated DICER COMPLEX, dices the VGAM2390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2390 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2390 RNA is designated SEQ ID:5101, and is provided hereinbelow with reference to the sequence listing part.

[33421] VGAM2390 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33422] VGAM2390 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2390 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2390 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33423] The complementary binding of VGAM2390 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2390 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[33424] It is appreciated that VGAM2390 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2390 host target genes. The mRNA of each one of this plurality of VGAM2390 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2390 RNA, herein designated VGAM RNA, and which when bound by VGAM2390 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2390 host target proteins.

[33425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2390 gene, herein designated VGAM GENE, on one or more VGAM2390 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33426] It is yet further appreciated that a function of VGAM2390 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2390 correlate with, and may be deduced from, the identity of the host target genes which VGAM2390 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33427] Nucleotide sequences of the VGAM2390 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2390 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2390 are further described hereinbelow with reference to Table 1.

[33428] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2390 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33429] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2391 (VGAM2391) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33430] VGAM2391 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2391 was detected is described hereinabove with reference to Figs. 2-8.

[33431] VGAM2391 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2391 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33432] VGAM2391 gene, herein designated VGAM GENE, encodes a VGAM2391 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2391 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2391 precursor RNA is designated SEQ ID:2377, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2377 is located at position 22657 relative to the genome of Goatpox virus.

[33433] VGAM2391 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33434] An enzyme complex designated DICER COMPLEX, dices the VGAM2391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2391 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2391 RNA is designated SEQ ID:5102, and is provided hereinbelow with reference to the sequence listing part.

[33435] VGAM2391 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33436] VGAM2391 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2391 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2391 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33437] The complementary binding of VGAM2391 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2391 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33438] It is appreciated that VGAM2391 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2391 host target genes. The mRNA of each one of this plurality of VGAM2391 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2391 RNA, herein designated VGAM RNA, and which when bound by VGAM2391 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2391 host target proteins.

[33439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2391 gene, herein designated VGAM GENE, on one or more VGAM2391 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33440] It is yet further appreciated that a function of VGAM2391 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2391 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2391 correlate with, and may be deduced from, the identity of the host target genes which VGAM2391 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33441] Nucleotide sequences of the VGAM2391 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2391 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2391 are further described hereinbelow with reference to Table 1.

[33442] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2391 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33443] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2392 (VGAM2392) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33444] VGAM2392 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2392 was detected is described hereinabove with reference to Figs. 2-8.

[33445] VGAM2392 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2392 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33446] VGAM2392 gene, herein designated VGAM GENE, encodes

a VGAM2392 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2392 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2392 precursor RNA is designated SEQ ID:2378, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2378 is located at position 9075 relative to the genome of Goatpox virus.

[33447] VGAM2392 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33448] An enzyme complex designated DICER COMPLEX, dices the VGAM2392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2392 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2392 RNA is designated SEQ ID:5103, and is provided hereinbelow with reference to the sequence listing part.

[33449] VGAM2392 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2392 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2392 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33450] VGAM2392 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2392 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2392 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2392 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2392 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33451] The complementary binding of VGAM2392 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2392 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2392 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2392 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33452] It is appreciated that VGAM2392 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2392 host target genes. The mRNA of each one of this plurality of VGAM2392 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2392 RNA, herein designated VGAM RNA, and which when bound by VGAM2392 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2392 host target proteins.

[33453] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2392 gene, herein designated VGAM GENE, on one or more VGAM2392 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33454] It is yet further appreciated that a function of VGAM2392 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2392 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2392 correlate with, and may be deduced from, the identity of the host target genes which VGAM2392 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33455] Nucleotide sequences of the VGAM2392 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2392 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2392 are further

described hereinbelow with reference to Table 1.

[33456] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2392 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33457] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2393 (VGAM2393) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33458] VGAM2393 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2393 was detected is described hereinabove with reference to Figs. 2-8.

[33459] VGAM2393 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2393 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33460] VGAM2393 gene, herein designated VGAM GENE, encodes a VGAM2393 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2393 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2393 precursor RNA is designated SEQ ID:2379, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2379 is located at position 35069 relative to the genome of Goatpox virus.

[33461] VGAM2393 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33462] An enzyme complex designated DICER COMPLEX, dices the VGAM2393 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2393 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2393 RNA is designated SEQ ID:5104, and is provided hereinbelow with reference to the sequence listing part.

[33463] VGAM2393 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2393 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2393 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33464] VGAM2393 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2393 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2393 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2393 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2393 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33465] The complementary binding of VGAM2393 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2393 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2393

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2393 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33466] It is appreciated that VGAM2393 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2393 host target genes. The mRNA of each one of this plurality of VGAM2393 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2393 RNA, herein designated VGAM RNA, and which when bound by VGAM2393 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2393 host target proteins.

[33467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2393 gene, herein designated VGAM GENE, on one or more VGAM2393 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33468] It is yet further appreciated that a function of VGAM2393 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2393 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2393 correlate with, and may be deduced from, the identity of the host target genes which VGAM2393 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33469] Nucleotide sequences of the VGAM2393 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2393 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2393 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2393 are further described hereinbelow with reference to Table 1.

[33470] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2393 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33471] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2394 (VGAM2394) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33472] VGAM2394 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2394 was detected is described hereinabove with reference to Figs. 2-8.

[33473] VGAM2394 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2394 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[33474] VGAM2394 gene, herein designated VGAM GENE, encodes a VGAM2394 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2394 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2394 precursor RNA is designated SEQ ID:2380, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2380 is located at position 149142 relative to the genome of Goatpox virus.

[33475] VGAM2394 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33476] An enzyme complex designated DICER COMPLEX, dices

the VGAM2394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2394 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2394 RNA is designated SEQ ID:5105, and is provided hereinbelow with reference to the sequence listing part.

[33477] VGAM2394 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2394 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2394 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33478] VGAM2394 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2394 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2394 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2394 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33479] The complementary binding of VGAM2394 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2394 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2394 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2394 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33480] It is appreciated that VGAM2394 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2394 host target genes. The mRNA of each one of this plurality of VGAM2394 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2394 RNA, herein designated VGAM RNA, and which when bound by VGAM2394 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2394 host target proteins.

[33481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2394 gene, herein designated VGAM GENE, on one or more VGAM2394 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33482] It is yet further appreciated that a function of VGAM2394 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2394 correlate with, and may be deduced from, the identity of the host target genes which VGAM2394 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33483] Nucleotide sequences of the VGAM2394 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2394 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2394 are further described hereinbelow with reference to Table 1.

[33484] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2394 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33485] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2395 (VGAM2395) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33486] VGAM2395 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2395 was detected is described hereinabove with reference to Figs. 2-8.

[33487] VGAM2395 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2395 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[33488] VGAM2395 gene, herein designated VGAM GENE, encodes a VGAM2395 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2395 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2395 precursor RNA is designated SEQ ID:2381, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2381 is located at position 120551 relative to the genome of Goatpox virus.

[33489] VGAM2395 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33490] An enzyme complex designated DICER COMPLEX, dices the VGAM2395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2395 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2395 RNA is designated SEQ ID:5106, and is provided hereinbelow with reference to the sequence listing part.

[33491] VGAM2395 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2395 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2395 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33492] VGAM2395 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2395 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2395 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2395 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2395 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33493] The complementary binding of VGAM2395 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2395 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2395 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2395 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33494] It is appreciated that VGAM2395 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2395 host target genes. The mRNA of each one of this plurality of VGAM2395 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2395 RNA, herein designated VGAM RNA, and which when bound by VGAM2395 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2395 host target proteins.

[33495] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2395 gene, herein designated VGAM GENE, on one or more VGAM2395 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33496] It is yet further appreciated that a function of VGAM2395 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2395 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2395 correlate with, and may be deduced from, the identity of the host target genes which VGAM2395 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33497] Nucleotide sequences of the VGAM2395 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2395 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2395 are further described hereinbelow with reference to Table 1.

[33498] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2395 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33499] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2396 (VGAM2396) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33500] VGAM2396 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2396 was detected is described hereinabove with reference to Figs. 2-8.

[33501] VGAM2396 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.

VGAM2396 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33502] VGAM2396 gene, herein designated VGAM GENE, encodes a VGAM2396 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2396 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2396 precursor RNA is designated SEQ ID:2382, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2382 is located at position 93517 relative to the genome of Goatpox virus.

[33503] VGAM2396 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[33504] An enzyme complex designated DICER COMPLEX, dices the VGAM2396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2396 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2396 RNA is designated SEQ ID:5107, and is provided hereinbelow with reference to the sequence listing part.

[33505] VGAM2396 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33506] VGAM2396 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2396 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2396 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33507] The complementary binding of VGAM2396 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2396 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33508] It is appreciated that VGAM2396 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2396 host target genes. The mRNA of each one of this plurality of VGAM2396 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2396 RNA, herein designated VGAM RNA, and which when bound by VGAM2396 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2396 host target proteins.

[33509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2396 gene, herein designated VGAM GENE, on one or more VGAM2396 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33510] It is yet further appreciated that a function of VGAM2396 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2396 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2396 correlate with, and may be deduced from, the identity of the host target genes which VGAM2396 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33511] Nucleotide sequences of the VGAM2396 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2396 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2396 are further described hereinbelow with reference to Table 1.

[33512] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2396 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33513] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2397 (VGAM2397) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33514] VGAM2397 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2397 was detected is described hereinabove with reference to Figs. 2-8.

[33515] VGAM2397 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Goatpox virus. VGAM2397 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33516] VGAM2397 gene, herein designated VGAM GENE, encodes a VGAM2397 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2397 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2397 precursor RNA is designated SEQ ID:2383, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2383 is located at position 149485 relative to the genome of Goatpox virus.

[33517] VGAM2397 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33518] An enzyme complex designated DICER COMPLEX, dices the VGAM2397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2397 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2397 RNA is designated SEQ ID:5108, and is provided hereinbelow with reference to the sequence listing part.

[33519] VGAM2397 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33520] VGAM2397 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2397 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2397 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33521] The complementary binding of VGAM2397 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2397 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33522] It is appreciated that VGAM2397 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2397 host target genes. The mRNA of each one of this plurality of VGAM2397 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2397 RNA, herein designated VGAM RNA, and which when bound by VGAM2397 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2397 host target proteins.

[33523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2397 gene, herein designated VGAM GENE, on one or more VGAM2397 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33524] It is yet further appreciated that a function of VGAM2397 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2397 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2397 correlate with, and may be deduced from, the identity of the host target genes which VGAM2397 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33525] Nucleotide sequences of the VGAM2397 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2397 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2397 are further described hereinbelow with reference to Table 1.

[33526] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2397 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33527] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2398 (VGAM2398) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33528] VGAM2398 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2398 was detected is described hereinabove with reference to Figs. 2-8.

[33529] VGAM2398 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2398 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33530] VGAM2398 gene, herein designated VGAM GENE, encodes a VGAM2398 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2398 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2398 precursor RNA is designated SEQ ID:2384, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2384 is located at position 101040 relative to the genome of Goatpox virus.

[33531] VGAM2398 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33532] An enzyme complex designated DICER COMPLEX, dices the VGAM2398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2398 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2398 RNA is designated SEQ ID:5109, and is provided hereinbelow with reference to the sequence listing part.

[33533] VGAM2398 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[33534] VGAM2398 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2398 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2398 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33535] The complementary binding of VGAM2398 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2398 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33536] It is appreciated that VGAM2398 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2398 host target genes. The mRNA of each one of this plurality of VGAM2398 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2398 RNA, herein designated VGAM RNA, and which when bound by VGAM2398 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2398 host target proteins.

[33537] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2398 gene, herein designated VGAM GENE, on one

or more VGAM2398 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33538] It is yet further appreciated that a function of VGAM2398 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2398 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2398 correlate with, and may be deduced from, the identity of the host target genes which VGAM2398 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33539] Nucleotide sequences of the VGAM2398 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2398 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2398 are further described hereinbelow with reference to Table 1.

[33540] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2398 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33541] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2399 (VGAM2399) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33542] VGAM2399 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2399 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[33543] VGAM2399 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2399 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33544] VGAM2399 gene, herein designated VGAM GENE, encodes a VGAM2399 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2399 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2399 precursor RNA is designated SEQ ID:2385, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2385 is located at position 23504 relative to the genome of Goatpox virus.

[33545] VGAM2399 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33546] An enzyme complex designated DICER COMPLEX, dices the VGAM2399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2399 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2399 RNA is designated SEQ ID:5110, and is provided hereinbelow with reference to the sequence listing part.

[33547] VGAM2399 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33548] VGAM2399 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2399 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[33549] The complementary binding of VGAM2399 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2399 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33550] It is appreciated that VGAM2399 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2399 host target genes. The mRNA of each one of this plurality of VGAM2399 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2399 RNA, herein designated VGAM RNA, and which when bound by VGAM2399 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2399 host target proteins.

[33551] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2399 gene, herein designated VGAM GENE, on one or more VGAM2399 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33552] It is yet further appreciated that a function of VGAM2399 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2399 correlate with, and may be deduced from, the identity of the host target genes which VGAM2399 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[33553] Nucleotide sequences of the VGAM2399 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2399 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2399 are further described hereinbelow with reference to Table 1.

[33554] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2399 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33555] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2400 (VGAM2400) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33556] VGAM2400 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2400 was detected is described hereinabove with reference to Figs. 2-8.

[33557] VGAM2400 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2400 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33558] VGAM2400 gene, herein designated VGAM GENE, encodes a VGAM2400 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2400 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2400 precursor RNA is designated SEQ ID:2386, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2386 is located at position 89837 relative to the genome of Goatpox virus.

[33559] VGAM2400 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33560] An enzyme complex designated DICER COMPLEX, dices the VGAM2400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2400 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2400 RNA is designated SEQ ID:5111, and is provided hereinbelow with reference to the sequence listing part.

[33561] VGAM2400 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2400 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2400 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33562] VGAM2400 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2400 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2400 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2400 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2400 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33563] The complementary binding of VGAM2400 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2400 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2400 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2400 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33564] It is appreciated that VGAM2400 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2400 host target genes. The mRNA of each one of this plurality of VGAM2400 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2400 RNA, herein designated VGAM RNA, and which when bound by VGAM2400 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2400 host target proteins.

[33565] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2400 gene, herein designated VGAM GENE, on one or more VGAM2400 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33566] It is yet further appreciated that a function of VGAM2400 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2400 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2400 correlate with, and may be deduced from, the identity of the host target genes which VGAM2400 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[33567] Nucleotide sequences of the VGAM2400 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2400 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2400 are further described hereinbelow with reference to Table 1.

[33568] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2400 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33569] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2401 (VGAM2401) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33570] VGAM2401 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2401 was detected is described hereinabove with reference to Figs. 2-8.

[33571] VGAM2401 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2401 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33572] VGAM2401 gene, herein designated VGAM GENE, encodes a VGAM2401 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2401 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2401 precursor RNA is designated SEQ ID:2387, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2387 is located at position 109414 relative to the genome of Goatpox virus.

[33573] VGAM2401 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33574] An enzyme complex designated DICER COMPLEX, dices the VGAM2401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2401 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2401 RNA is designated SEQ ID:5112, and is provided hereinbelow with reference to the sequence listing part.

[33575] VGAM2401 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33576] VGAM2401 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2401 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33577] The complementary binding of VGAM2401 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2401 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33578] It is appreciated that VGAM2401 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2401 host target genes. The mRNA of each one of this plurality of VGAM2401 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2401 RNA, herein designated VGAM RNA, and which when bound by VGAM2401 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2401 host target proteins.

[33579] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2401 gene, herein designated VGAM GENE, on one or more VGAM2401 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33580] It is yet further appreciated that a function of VGAM2401 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2401 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2401 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33581] Nucleotide sequences of the VGAM2401 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2401 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2401 are further described hereinbelow with reference to Table 1.

[33582] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2401 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33583] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2402 (VGAM2402) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33584] VGAM2402 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2402 was detected is described hereinabove with reference to Figs. 2-8.

[33585] VGAM2402 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2402 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33586] VGAM2402 gene, herein designated VGAM GENE, encodes a VGAM2402 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2402 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2402 precursor RNA is designated SEQ ID:2388, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2388 is located at position 702 relative to the genome of Goatpox virus.

[33587] VGAM2402 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2402 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33588] An enzyme complex designated DICER COMPLEX, dices the VGAM2402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2402 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2402 RNA is designated SEQ ID:5113, and is provided hereinbelow with reference to the sequence listing part.

[33589] VGAM2402 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2402 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2402 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33590] VGAM2402 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2402 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2402 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2402 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33591] The complementary binding of VGAM2402 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2402 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2402 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2402 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33592] It is appreciated that VGAM2402 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2402 host target genes. The mRNA of each one of this plurality of VGAM2402 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2402 RNA, herein designated VGAM RNA, and which when bound by VGAM2402 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2402 host target proteins.

[33593] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2402 gene, herein designated VGAM GENE, on one or more VGAM2402 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33594] It is yet further appreciated that a function of VGAM2402 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2402 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2402 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33595] Nucleotide sequences of the VGAM2402 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2402 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2402 are further described hereinbelow with reference to Table 1.

[33596] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2402 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33597] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2403 (VGAM2403) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[33598] VGAM2403 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2403 was detected is described hereinabove with reference to Figs. 2-8.

[33599] VGAM2403 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2403 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33600] VGAM2403 gene, herein designated VGAM GENE, encodes a VGAM2403 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2403 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2403 precursor RNA is designated SEQ ID:2389, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2389 is located at position 52365 relative to the genome of Goatpox virus.

[33601] VGAM2403 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2403 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33602] An enzyme complex designated DICER COMPLEX, dices the VGAM2403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2403 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM2403 RNA is designated SEQ ID:5114, and is provided hereinbelow with reference to the sequence listing part.

[33603] VGAM2403 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2403 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2403 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33604] VGAM2403 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2403 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2403 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2403 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2403 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33605] The complementary binding of VGAM2403 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2403 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2403 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2403 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33606] It is appreciated that VGAM2403 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2403 host target genes. The mRNA of each one of this plurality of VGAM2403 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2403 RNA, herein designated VGAM RNA, and which when bound by VGAM2403 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2403 host target proteins.

[33607] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2403 gene, herein designated VGAM GENE, on one or more VGAM2403 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33608] It is yet further appreciated that a function of VGAM2403 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2403 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific

functions, and accordingly utilities, of VGAM2403 correlate with, and may be deduced from, the identity of the host target genes which VGAM2403 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33609] Nucleotide sequences of the VGAM2403 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2403 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2403 are further described hereinbelow with reference to Table 1.

[33610] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2403 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33611] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2404 (VGAM2404) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[33612] VGAM2404 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2404 was detected is described hereinabove with reference to Figs. 2-8.

[33613] VGAM2404 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2404 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33614] VGAM2404 gene, herein designated VGAM GENE, encodes a VGAM2404 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2404 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2404 precursor RNA is designated SEQ ID:2390, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2390 is located at position 65726 relative to the genome of Goatpox virus.

[33615] VGAM2404 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33616] An enzyme complex designated DICER COMPLEX, dices the VGAM2404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2404 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2404 RNA is designated SEQ ID:5115, and is provided hereinbelow with reference to the sequence listing part.

[33617] VGAM2404 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2404 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2404 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33618] VGAM2404 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2404 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2404 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2404 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33619] The complementary binding of VGAM2404 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2404 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2404 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2404 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33620] It is appreciated that VGAM2404 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2404 host target genes. The mRNA of each one of this plurality of VGAM2404 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2404 RNA, herein designated VGAM RNA, and which when bound by VGAM2404 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2404 host target proteins.

[33621] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2404 gene, herein designated VGAM GENE, on one or more VGAM2404 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33622] It is yet further appreciated that a function of VGAM2404 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2404 include diagnosis, prevention and

treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2404 correlate with, and may be deduced from, the identity of the host target genes which VGAM2404 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33623] Nucleotide sequences of the VGAM2404 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2404 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2404 are further described hereinbelow with reference to Table 1.

[33624] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2404 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33625] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2405 (VGAM2405) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33626] VGAM2405 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2405 was detected is described hereinabove with reference to Figs. 2-8.

[33627] VGAM2405 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2405 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33628] VGAM2405 gene, herein designated VGAM GENE, encodes a VGAM2405 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2405 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2405 precursor RNA is designated SEQ ID:2391, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2391 is located at position 127713 relative to the genome of Goatpox virus.

[33629] VGAM2405 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33630] An enzyme complex designated DICER COMPLEX, dices the VGAM2405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2405 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2405 RNA is designated SEQ ID:5116, and is provided hereinbelow with reference to the sequence listing part.

[33631] VGAM2405 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33632] VGAM2405 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2405 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33633] The complementary binding of VGAM2405 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2405 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33634] It is appreciated that VGAM2405 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2405 host target genes. The mRNA of each one of this plurality of VGAM2405 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2405 RNA, herein designated VGAM

RNA, and which when bound by VGAM2405 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2405 host target proteins.

[33635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2405 gene, herein designated VGAM GENE, on one or more VGAM2405 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33636] It is yet further appreciated that a function of VGAM2405 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2405 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2405 correlate with, and may be deduced from, the identity of the host target genes which VGAM2405 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33637] Nucleotide sequences of the VGAM2405 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2405 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2405 are further described hereinbelow with reference to Table 1.

[33638] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2405 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33639] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2406 (VGAM2406) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33640] VGAM2406 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2406 was detected is described hereinabove with reference to Figs. 2-8.

[33641] VGAM2406 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2406 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33642] VGAM2406 gene, herein designated VGAM GENE, encodes a VGAM2406 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2406 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2406 precursor RNA is designated SEQ ID:2392, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2392 is located at position

118549 relative to the genome of Goatpox virus.

[33643] VGAM2406 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33644] An enzyme complex designated DICER COMPLEX, dices the VGAM2406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2406 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2406 RNA is designated SEQ ID:5117, and is provided hereinbelow with reference to the sequence listing part.

[33645] VGAM2406 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2406 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2406 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33646] VGAM2406 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2406 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2406 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2406 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2406 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33647] The complementary binding of VGAM2406 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2406 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2406 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2406 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33648] It is appreciated that VGAM2406 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2406 host target genes. The mRNA of each one of this plurality of VGAM2406 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2406 RNA, herein designated VGAM RNA, and which when bound by VGAM2406 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2406 host target proteins.

[33649] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2406 gene, herein designated VGAM GENE, on one or more VGAM2406 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33650] It is yet further appreciated that a function of VGAM2406 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2406 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2406 correlate with, and may be deduced from, the identity of the host target genes which VGAM2406 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33651] Nucleotide sequences of the VGAM2406 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2406 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2406 are further described hereinbelow with reference to Table 1.

[33652] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2406 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33653] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2407 (VGAM2407) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33654] VGAM2407 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2407 was detected is described hereinabove with reference to Figs. 2-8.

[33655] VGAM2407 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2407 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33656] VGAM2407 gene, herein designated VGAM GENE, encodes a VGAM2407 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2407 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2407 precursor RNA is designated SEQ ID:2393, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2393 is located at position 111620 relative to the genome of Goatpox virus.

[33657] VGAM2407 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33658] An enzyme complex designated DICER COMPLEX, dices the VGAM2407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2407 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2407 RNA is designated SEQ ID:5118, and is provided hereinbelow with reference to the sequence listing part.

[33659] VGAM2407 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[33660] VGAM2407 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2407 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2407 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33661] The complementary binding of VGAM2407 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2407 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33662] It is appreciated that VGAM2407 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2407 host target genes. The mRNA of each one of this plurality of VGAM2407 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2407 RNA, herein designated VGAM RNA, and which when bound by VGAM2407 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2407 host target proteins.

[33663] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2407 gene, herein designated VGAM GENE, on one

or more VGAM2407 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33664] It is yet further appreciated that a function of VGAM2407 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2407 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2407 correlate with, and may be deduced from, the identity of the host target genes which VGAM2407 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33665] Nucleotide sequences of the VGAM2407 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2407 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2407 are further described hereinbelow with reference to Table 1.

[33666] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2407 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33667] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2408 (VGAM2408) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33668] VGAM2408 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2408 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[33669] VGAM2408 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2408 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33670] VGAM2408 gene, herein designated VGAM GENE, encodes a VGAM2408 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2408 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2408 precursor RNA is designated SEQ ID:2394, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2394 is located at position 36819 relative to the genome of Goatpox virus.

[33671] VGAM2408 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33672] An enzyme complex designated DICER COMPLEX, dices the VGAM2408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2408 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2408 RNA is designated SEQ ID:5119, and is provided hereinbelow with reference to the sequence listing part.

[33673] VGAM2408 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33674] VGAM2408 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2408 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2408 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[33675] The complementary binding of VGAM2408 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2408 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33676] It is appreciated that VGAM2408 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2408 host target genes. The mRNA of each one of this plurality of VGAM2408 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2408 RNA, herein designated VGAM RNA, and which when bound by VGAM2408 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2408 host target proteins.

[33677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2408 gene, herein designated VGAM GENE, on one or more VGAM2408 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33678] It is yet further appreciated that a function of VGAM2408 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2408 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2408 correlate with, and may be deduced from, the identity of the host target genes which VGAM2408 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[33679] Nucleotide sequences of the VGAM2408 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2408 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2408 are further described hereinbelow with reference to Table 1.

[33680] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2408 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33681] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2409 (VGAM2409) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33682] VGAM2409 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2409 was detected is described hereinabove with reference to Figs. 2-8.

[33683] VGAM2409 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2409 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33684] VGAM2409 gene, herein designated VGAM GENE, encodes a VGAM2409 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2409 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2409 precursor RNA is designated SEQ ID:2395, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2395 is located at position 109177 relative to the genome of Goatpox virus.

[33685] VGAM2409 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33686] An enzyme complex designated DICER COMPLEX, dices the VGAM2409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2409 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2409 RNA is designated SEQ ID:5120, and is provided hereinbelow with reference to the sequence listing part.

[33687] VGAM2409 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33688] VGAM2409 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2409 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2409 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33689] The complementary binding of VGAM2409 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2409 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33690] It is appreciated that VGAM2409 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2409 host target genes. The mRNA of each one of this plurality of VGAM2409 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2409 RNA, herein designated VGAM RNA, and which when bound by VGAM2409 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2409 host target proteins.

[33691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2409 gene, herein designated VGAM GENE, on one or more VGAM2409 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33692] It is yet further appreciated that a function of VGAM2409 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2409 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2409 correlate with, and may be deduced from, the identity of the host target genes which VGAM2409 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[33693] Nucleotide sequences of the VGAM2409 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2409 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2409 are further described hereinbelow with reference to Table 1.

[33694] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2409 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33695] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2410 (VGAM2410) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33696] VGAM2410 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2410 was detected is described hereinabove with reference to Figs. 2-8.

[33697] VGAM2410 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2410 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33698] VGAM2410 gene, herein designated VGAM GENE, encodes a VGAM2410 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2410 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2410 precursor RNA is designated SEQ ID:2396, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2396 is located at position 118894 relative to the genome of Goatpox virus.

[33699] VGAM2410 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33700] An enzyme complex designated DICER COMPLEX, dices the VGAM2410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2410 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2410 RNA is designated SEQ ID:5121, and is provided hereinbelow with reference to the sequence listing part.

[33701] VGAM2410 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33702] VGAM2410 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2410 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2410 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33703] The complementary binding of VGAM2410 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2410 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33704] It is appreciated that VGAM2410 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2410 host target genes. The mRNA of each one of this plurality of VGAM2410 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2410 RNA, herein designated VGAM RNA, and which when bound by VGAM2410 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2410 host target proteins.

[33705] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2410 gene, herein designated VGAM GENE, on one or more VGAM2410 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33706] It is yet further appreciated that a function of VGAM2410 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2410 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2410 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2410 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33707] Nucleotide sequences of the VGAM2410 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2410 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2410 are further described hereinbelow with reference to Table 1.

[33708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2410 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33709] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2411 (VGAM2411) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33710] VGAM2411 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2411 was detected is described hereinabove with reference to Figs. 2-8.

[33711] VGAM2411 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2411 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33712] VGAM2411 gene, herein designated VGAM GENE, encodes a VGAM2411 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2411 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2411 precursor RNA is designated SEQ ID:2397, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2397 is located at position 74764 relative to the genome of Goatpox virus.

[33713] VGAM2411 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2411 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33714] An enzyme complex designated DICER COMPLEX, dices the VGAM2411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2411 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2411 RNA is designated SEQ ID:5122, and is provided hereinbelow with reference to the sequence listing part.

[33715] VGAM2411 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2411 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2411 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33716] VGAM2411 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2411 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2411 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2411 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2411 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33717] The complementary binding of VGAM2411 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2411 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2411 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2411 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33718] It is appreciated that VGAM2411 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2411 host target genes. The mRNA of each one of this plurality of VGAM2411 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2411 RNA, herein designated VGAM RNA, and which when bound by VGAM2411 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2411 host target proteins.

[33719] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2411 gene, herein designated VGAM GENE, on one or more VGAM2411 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33720] It is yet further appreciated that a function of VGAM2411 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2411 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2411 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2411 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33721] Nucleotide sequences of the VGAM2411 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2411 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2411 are further described hereinbelow with reference to Table 1.

[33722] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2411 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33723] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2412 (VGAM2412) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[33724] VGAM2412 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2412 was detected is described hereinabove with reference to Figs. 2-8.

[33725] VGAM2412 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2412 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33726] VGAM2412 gene, herein designated VGAM GENE, encodes a VGAM2412 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2412 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2412 precursor RNA is designated SEQ ID:2398, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2398 is located at position 52802 relative to the genome of Goatpox virus.

[33727] VGAM2412 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2412 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33728] An enzyme complex designated DICER COMPLEX, dices the VGAM2412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2412 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM2412 RNA is designated SEQ ID:5123, and is provided hereinbelow with reference to the sequence listing part.

[33729] VGAM2412 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2412 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2412 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33730] VGAM2412 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2412 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2412 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2412 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33731] The complementary binding of VGAM2412 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2412 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2412 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2412 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33732] It is appreciated that VGAM2412 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2412 host target genes. The mRNA of each one of this plurality of VGAM2412 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2412 RNA, herein designated VGAM RNA, and which when bound by VGAM2412 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2412 host target proteins.

[33733] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2412 gene, herein designated VGAM GENE, on one or more VGAM2412 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33734] It is yet further appreciated that a function of VGAM2412 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific

functions, and accordingly utilities, of VGAM2412 correlate with, and may be deduced from, the identity of the host target genes which VGAM2412 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33735] Nucleotide sequences of the VGAM2412 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2412 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2412 are further described hereinbelow with reference to Table 1.

[33736] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2412 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33737] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2413 (VGAM2413) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[33738] VGAM2413 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2413 was detected is described hereinabove with reference to Figs. 2-8.

[33739] VGAM2413 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2413 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33740] VGAM2413 gene, herein designated VGAM GENE, encodes a VGAM2413 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2413 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2413 precursor RNA is designated SEQ ID:2399, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2399 is located at position 77043 relative to the genome of Goatpox virus.

[33741] VGAM2413 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33742] An enzyme complex designated DICER COMPLEX, dices the VGAM2413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2413 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2413 RNA is designated SEQ ID:5124, and is provided hereinbelow with reference to the sequence listing part.

[33743] VGAM2413 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2413 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2413 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33744] VGAM2413 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2413 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2413 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2413 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2413 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33745] The complementary binding of VGAM2413 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2413 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2413 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2413 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33746] It is appreciated that VGAM2413 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2413 host target genes. The mRNA of each one of this plurality of VGAM2413 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2413 RNA, herein designated VGAM RNA, and which when bound by VGAM2413 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2413 host target proteins.

[33747] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2413 gene, herein designated VGAM GENE, on one or more VGAM2413 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33748] It is yet further appreciated that a function of VGAM2413 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2413 include diagnosis, prevention and

treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2413 correlate with, and may be deduced from, the identity of the host target genes which VGAM2413 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33749] Nucleotide sequences of the VGAM2413 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2413 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2413 are further described hereinbelow with reference to Table 1.

[33750] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2413 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33751] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2414 (VGAM2414) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33752] VGAM2414 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2414 was detected is described hereinabove with reference to Figs. 2-8.

[33753] VGAM2414 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2414 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33754] VGAM2414 gene, herein designated VGAM GENE, encodes a VGAM2414 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2414 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2414 precursor RNA is designated SEQ ID:2400, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2400 is located at position 57820 relative to the genome of Goatpox virus.

[33755] VGAM2414 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33756] An enzyme complex designated DICER COMPLEX, dices the VGAM2414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2414 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2414 RNA is designated SEQ ID:5125, and is provided hereinbelow with reference to the sequence listing part.

[33757] VGAM2414 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2414 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2414 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33758] VGAM2414 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2414 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2414 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2414 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33759] The complementary binding of VGAM2414 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2414 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2414 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2414 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33760] It is appreciated that VGAM2414 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2414 host target genes. The mRNA of each one of this plurality of VGAM2414 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2414 RNA, herein designated VGAM

RNA, and which when bound by VGAM2414 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2414 host target proteins.

[33761] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2414 gene, herein designated VGAM GENE, on one or more VGAM2414 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33762] It is yet further appreciated that a function of VGAM2414 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2414 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2414 correlate with, and may be deduced from, the identity of the host target genes which VGAM2414 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33763] Nucleotide sequences of the VGAM2414 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2414 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2414 are further described hereinbelow with reference to Table 1.

[33764] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2414 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33765]

[33766] Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present inven-

tion, referred to here as Viral Genomic Address Messenger 2415 (VGAM2415) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33767] VGAM2415 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2415 was detected is described hereinabove with reference to Figs. 2-8.

[33768] VGAM2415 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2415 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33769] VGAM2415 gene, herein designated VGAM GENE, encodes a VGAM2415 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2415 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2415 precursor RNA is designated SEQ ID:2401, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2401 is located at position

96068 relative to the genome of Goatpox virus.

[33770] VGAM2415 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33771] An enzyme complex designated DICER COMPLEX, dices the VGAM2415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2415 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2415 RNA is designated SEQ ID:5126, and is provided hereinbelow with reference to the sequence listing part.

[33772] VGAM2415 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33773] VGAM2415 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2415 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2415 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33774] The complementary binding of VGAM2415 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2415 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33775] It is appreciated that VGAM2415 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2415 host target genes. The mRNA of each one of this plurality of VGAM2415 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2415 RNA, herein designated VGAM RNA, and which when bound by VGAM2415 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2415 host target proteins.

[33776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2415 gene, herein designated VGAM GENE, on one or more VGAM2415 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33777] It is yet further appreciated that a function of VGAM2415 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2415 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2415 correlate with, and may be deduced from, the identity of the host target genes which VGAM2415 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33778] Nucleotide sequences of the VGAM2415 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2415 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2415 are further described hereinbelow with reference to Table 1.

[33779] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2415 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33780] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2416 (VGAM2416) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33781] VGAM2416 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2416 was detected is described hereinabove with reference to Figs. 2-8.

[33782] VGAM2416 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2416 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33783] VGAM2416 gene, herein designated VGAM GENE, encodes a VGAM2416 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2416 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2416 precursor RNA is designated SEQ ID:2402, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2402 is located at position 126030 relative to the genome of Goatpox virus.

[33784] VGAM2416 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33785] An enzyme complex designated DICER COMPLEX, dices the VGAM2416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2416 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2416 RNA is designated SEQ ID:5127, and is provided hereinbelow with reference to the sequence

listing part.

[33786] VGAM2416 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33787] VGAM2416 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2416 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33788] The complementary binding of VGAM2416 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2416 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33789] It is appreciated that VGAM2416 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2416 host target genes. The mRNA of each one of this plurality of VGAM2416 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2416 RNA, herein designated VGAM RNA, and which when bound by VGAM2416 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2416 host target proteins.

[33790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2416 gene, herein designated VGAM GENE, on one or more VGAM2416 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33791] It is yet further appreciated that a function of VGAM2416

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2416 correlate with, and may be deduced from, the identity of the host target genes which VGAM2416 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33792] Nucleotide sequences of the VGAM2416 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2416 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2416 are further described hereinbelow with reference to Table 1.

[33793] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2416 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33794] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2417 (VGAM2417) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33795] VGAM2417 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2417 was detected is described hereinabove with reference to Figs. 2-8.

[33796] VGAM2417 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2417 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33797] VGAM2417 gene, herein designated VGAM GENE, encodes a VGAM2417 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2417 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2417 precursor RNA is designated SEQ ID:2403, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2403 is located at position 96899 relative to the genome of Goatpox virus.

[33798] VGAM2417 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33799] An enzyme complex designated DICER COMPLEX, dices the VGAM2417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2417 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2417 RNA is designated SEQ ID:5128, and

is provided hereinbelow with reference to the sequence listing part.

[33800] VGAM2417 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2417 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2417 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33801] VGAM2417 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2417 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2417 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2417 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33802] The complementary binding of VGAM2417 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2417 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2417 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2417 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33803] It is appreciated that VGAM2417 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2417 host target genes. The mRNA of each one of this plurality of VGAM2417 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2417 RNA, herein designated VGAM RNA, and which when bound by VGAM2417 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2417 host target proteins.

[33804] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2417 gene, herein designated VGAM GENE, on one or more VGAM2417 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33805] It is yet further appreciated that a function of VGAM2417 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2417 correlate with, and may be deduced from, the identity of the host target genes which VGAM2417 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33806] Nucleotide sequences of the VGAM2417 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2417 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2417 are further described hereinbelow with reference to Table 1.

[33807] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2417 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33808] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2418 (VGAM2418) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33809] VGAM2418 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2418 was detected is described hereinabove with reference to Figs. 2-8.

[33810] VGAM2418 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2418 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33811] VGAM2418 gene, herein designated VGAM GENE, encodes a VGAM2418 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2418 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2418 precur-

sor RNA is designated SEQ ID:2404, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2404 is located at position 117185 relative to the genome of Goatpox virus.

[33812] VGAM2418 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33813] An enzyme complex designated DICER COMPLEX, dices the VGAM2418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2418 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM2418 RNA is designated SEQ ID:5129, and is provided hereinbelow with reference to the sequence listing part.

[33814] VGAM2418 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2418 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2418 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33815] VGAM2418 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2418 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2418 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2418 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2418 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33816] The complementary binding of VGAM2418 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2418 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2418 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2418 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33817] It is appreciated that VGAM2418 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2418 host target genes. The mRNA of

each one of this plurality of VGAM2418 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2418 RNA, herein designated VGAM RNA, and which when bound by VGAM2418 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2418 host target proteins.

[33818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2418 gene, herein designated VGAM GENE, on one or more VGAM2418 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[33819] It is yet further appreciated that a function of VGAM2418 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2418 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2418 correlate with, and may be deduced from, the identity of the host target genes which VGAM2418 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33820] Nucleotide sequences of the VGAM2418 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2418 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2418 are further described hereinbelow with reference to Table 1.

[33821] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2418 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[33822] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2419 (VGAM2419) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33823] VGAM2419 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2419 was detected is described hereinabove with reference to Figs. 2-8.

[33824] VGAM2419 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2419 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33825] VGAM2419 gene, herein designated VGAM GENE, encodes a VGAM2419 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2419 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2419 precursor RNA is designated SEQ ID:2405, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2405 is located at position 104440 relative to the genome of Goatpox virus.

[33826] VGAM2419 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33827] An enzyme complex designated DICER COMPLEX, dices the VGAM2419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2419 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2419 RNA is designated SEQ ID:5130, and is provided hereinbelow with reference to the sequence listing part.

[33828] VGAM2419 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33829] VGAM2419 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2419 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2419 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33830] The complementary binding of VGAM2419 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2419 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33831] It is appreciated that VGAM2419 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2419 host target genes. The mRNA of each one of this plurality of VGAM2419 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2419 RNA, herein designated VGAM RNA, and which when bound by VGAM2419 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2419 host target proteins.

[33832] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2419 gene, herein designated VGAM GENE, on one or more VGAM2419 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33833] It is yet further appreciated that a function of VGAM2419 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2419 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2419 correlate with, and may be deduced from, the identity of the host target genes which VGAM2419 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33834] Nucleotide sequences of the VGAM2419 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2419 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2419 are further described hereinbelow with reference to Table 1.

[33835] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2419 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33836] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2420 (VGAM2420) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33837] VGAM2420 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2420 was detected is described hereinabove with reference to Figs. 2-8.

[33838] VGAM2420 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2420 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33839] VGAM2420 gene, herein designated VGAM GENE, encodes a VGAM2420 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2420 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2420 precursor RNA is designated SEQ ID:2406, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2406 is located at position 138753 relative to the genome of Goatpox virus.

[33840] VGAM2420 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33841] An enzyme complex designated DICER COMPLEX, dices the VGAM2420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2420 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2420 RNA is designated SEQ ID:5131, and is provided hereinbelow with reference to the sequence listing part.

[33842] VGAM2420 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33843] VGAM2420 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2420 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33844] The complementary binding of VGAM2420 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2420 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33845] It is appreciated that VGAM2420 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2420 host target genes. The mRNA of each one of this plurality of VGAM2420 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2420 RNA, herein designated VGAM RNA, and which when bound by VGAM2420 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2420 host target proteins.

[33846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2420 gene, herein designated VGAM GENE, on one or more VGAM2420 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33847] It is yet further appreciated that a function of VGAM2420 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2420 correlate with, and may be deduced from, the identity of the host target genes which VGAM2420 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33848] Nucleotide sequences of the VGAM2420 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2420 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2420 are further described hereinbelow with reference to Table 1.

[33849] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2420 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33850] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2421 (VGAM2421) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33851] VGAM2421 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2421 was detected is described hereinabove with reference to Figs. 2-8.

[33852] VGAM2421 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2421 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33853] VGAM2421 gene, herein designated VGAM GENE, encodes a VGAM2421 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2421 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2421 precursor RNA is designated SEQ ID:2407, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2407 is located at position 87501 relative to the genome of Goatpox virus.

[33854] VGAM2421 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33855] An enzyme complex designated DICER COMPLEX, dices the VGAM2421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2421 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2421 RNA is designated SEQ ID:5132, and is provided hereinbelow with reference to the sequence listing part.

[33856] VGAM2421 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33857] VGAM2421 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2421 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2421 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33858] The complementary binding of VGAM2421 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2421 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33859] It is appreciated that VGAM2421 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2421 host target genes. The mRNA of each one of this plurality of VGAM2421 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2421 RNA, herein designated VGAM RNA, and which when bound by VGAM2421 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2421 host target proteins.

[33860] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2421 gene, herein designated VGAM GENE, on one or more VGAM2421 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33861] It is yet further appreciated that a function of VGAM2421 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2421 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2421 correlate with, and may be deduced from, the identity of the host target genes which VGAM2421 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33862] Nucleotide sequences of the VGAM2421 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2421 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2421 are further described hereinbelow with reference to Table 1.

[33863] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2421 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33864] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2422 (VGAM2422) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33865] VGAM2422 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2422 was detected is described hereinabove with reference to Figs. 2-8.

[33866] VGAM2422 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2422 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33867] VGAM2422 gene, herein designated VGAM GENE, encodes a VGAM2422 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2422 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2422 precursor RNA is designated SEQ ID:2408, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2408 is located at position 83441 relative to the genome of Goatpox virus.

[33868] VGAM2422 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33869] An enzyme complex designated DICER COMPLEX, dices the VGAM2422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2422 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2422 RNA is designated SEQ ID:5133, and is provided hereinbelow with reference to the sequence listing part.

[33870] VGAM2422 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33871] VGAM2422 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2422 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2422 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33872] The complementary binding of VGAM2422 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2422 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[33873] It is appreciated that VGAM2422 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2422 host target genes. The mRNA of each one of this plurality of VGAM2422 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2422 RNA, herein designated VGAM RNA, and which when bound by VGAM2422 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2422 host target proteins.

[33874] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2422 gene, herein designated VGAM GENE, on one or more VGAM2422 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33875] It is yet further appreciated that a function of VGAM2422 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2422 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2422 correlate with, and may be deduced from, the identity of the host target genes which VGAM2422 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33876] Nucleotide sequences of the VGAM2422 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2422 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2422 are further described hereinbelow with reference to Table 1.

[33877] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2422 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33878] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2423 (VGAM2423) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33879] VGAM2423 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2423 was detected is described hereinabove with reference to Figs. 2-8.

[33880] VGAM2423 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2423 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33881] VGAM2423 gene, herein designated VGAM GENE, encodes a VGAM2423 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2423 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2423 precursor RNA is designated SEQ ID:2409, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2409 is located at position 74429 relative to the genome of Goatpox virus.

[33882] VGAM2423 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33883] An enzyme complex designated DICER COMPLEX, dices the VGAM2423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2423 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2423 RNA is designated SEQ ID:5134, and is provided hereinbelow with reference to the sequence listing part.

[33884] VGAM2423 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33885] VGAM2423 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2423 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2423 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33886] The complementary binding of VGAM2423 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2423 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33887] It is appreciated that VGAM2423 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2423 host target genes. The mRNA of each one of this plurality of VGAM2423 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2423 RNA, herein designated VGAM RNA, and which when bound by VGAM2423 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2423 host target proteins.

[33888] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2423 gene, herein designated VGAM GENE, on one or more VGAM2423 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33889] It is yet further appreciated that a function of VGAM2423 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2423 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2423 correlate with, and may be deduced from, the identity of the host target genes which VGAM2423 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33890] Nucleotide sequences of the VGAM2423 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2423 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2423 are further described hereinbelow with reference to Table 1.

[33891] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2423 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33892] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2424 (VGAM2424) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33893] VGAM2424 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2424 was detected is described hereinabove with reference to Figs. 2-8.

[33894] VGAM2424 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2424 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33895] VGAM2424 gene, herein designated VGAM GENE, encodes

a VGAM2424 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2424 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2424 precursor RNA is designated SEQ ID:2410, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2410 is located at position 134679 relative to the genome of Goatpox virus.

[33896] VGAM2424 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33897] An enzyme complex designated DICER COMPLEX, dices the VGAM2424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2424 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2424 RNA is designated SEQ ID:5135, and is provided hereinbelow with reference to the sequence listing part.

[33898] VGAM2424 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2424 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2424 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33899] VGAM2424 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2424 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2424 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2424 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2424 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33900] The complementary binding of VGAM2424 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2424 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2424 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2424 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33901] It is appreciated that VGAM2424 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2424 host target genes. The mRNA of each one of this plurality of VGAM2424 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2424 RNA, herein designated VGAM RNA, and which when bound by VGAM2424 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2424 host target proteins.

[33902] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2424 gene, herein designated VGAM GENE, on one or more VGAM2424 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33903] It is yet further appreciated that a function of VGAM2424 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2424 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2424 correlate with, and may be deduced from, the identity of the host target genes which VGAM2424 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33904] Nucleotide sequences of the VGAM2424 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2424 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2424 are further

described hereinbelow with reference to Table 1.

[33905] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2424 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33906] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2425 (VGAM2425) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33907] VGAM2425 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2425 was detected is described hereinabove with reference to Figs. 2-8.

[33908] VGAM2425 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2425 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33909] VGAM2425 gene, herein designated VGAM GENE, encodes a VGAM2425 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2425 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2425 precursor RNA is designated SEQ ID:2411, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2411 is located at position 148298 relative to the genome of Goatpox virus.

[33910] VGAM2425 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33911] An enzyme complex designated DICER COMPLEX, dices the VGAM2425 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2425 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2425 RNA is designated SEQ ID:5136, and is provided hereinbelow with reference to the sequence listing part.

[33912] VGAM2425 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2425 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2425 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33913] VGAM2425 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2425 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2425 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2425 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33914] The complementary binding of VGAM2425 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2425 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2425

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2425 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33915] It is appreciated that VGAM2425 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2425 host target genes. The mRNA of each one of this plurality of VGAM2425 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2425 RNA, herein designated VGAM RNA, and which when bound by VGAM2425 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2425 host target proteins.

[33916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2425 gene, herein designated VGAM GENE, on one or more VGAM2425 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33917] It is yet further appreciated that a function of VGAM2425 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2425 correlate with, and may be deduced from, the identity of the host target genes which VGAM2425 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33918] Nucleotide sequences of the VGAM2425 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2425 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2425 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2425 are further described hereinbelow with reference to Table 1.

[33919] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2425 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33920] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2426 (VGAM2426) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33921] VGAM2426 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2426 was detected is described hereinabove with reference to Figs. 2-8.

[33922] VGAM2426 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2426 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[33923] VGAM2426 gene, herein designated VGAM GENE, encodes a VGAM2426 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2426 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2426 precursor RNA is designated SEQ ID:2412, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2412 is located at position 51036 relative to the genome of Goatpox virus.

[33924] VGAM2426 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33925] An enzyme complex designated DICER COMPLEX, dices

the VGAM2426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2426 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2426 RNA is designated SEQ ID:5137, and is provided hereinbelow with reference to the sequence listing part.

[33926] VGAM2426 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2426 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2426 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33927] VGAM2426 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2426 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2426 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2426 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2426 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33928] The complementary binding of VGAM2426 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2426 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2426 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2426 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33929] It is appreciated that VGAM2426 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2426 host target genes. The mRNA of each one of this plurality of VGAM2426 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2426 RNA, herein designated VGAM RNA, and which when bound by VGAM2426 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2426 host target proteins.

[33930] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2426 gene, herein designated VGAM GENE, on one or more VGAM2426 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33931] It is yet further appreciated that a function of VGAM2426 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2426 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2426 correlate with, and may be deduced from, the identity of the host target genes which VGAM2426 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33932] Nucleotide sequences of the VGAM2426 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2426 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2426 are further described hereinbelow with reference to Table 1.

[33933] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2426 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33934] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2427 (VGAM2427) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33935] VGAM2427 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2427 was detected is described hereinabove with reference to Figs. 2-8.

[33936] VGAM2427 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2427 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[33937] VGAM2427 gene, herein designated VGAM GENE, encodes a VGAM2427 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2427 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2427 precursor RNA is designated SEQ ID:2413, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2413 is located at position 48019 relative to the genome of Goatpox virus.

[33938] VGAM2427 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33939] An enzyme complex designated DICER COMPLEX, dices the VGAM2427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2427 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2427 RNA is designated SEQ ID:5138, and is provided hereinbelow with reference to the sequence listing part.

[33940] VGAM2427 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2427 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2427 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33941] VGAM2427 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2427 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2427 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2427 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33942] The complementary binding of VGAM2427 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2427 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2427 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2427 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33943] It is appreciated that VGAM2427 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2427 host target genes. The mRNA of each one of this plurality of VGAM2427 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2427 RNA, herein designated VGAM RNA, and which when bound by VGAM2427 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2427 host target proteins.

[33944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2427 gene, herein designated VGAM GENE, on one or more VGAM2427 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33945] It is yet further appreciated that a function of VGAM2427 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2427 correlate with, and may be deduced from, the identity of the host target genes which VGAM2427 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33946] Nucleotide sequences of the VGAM2427 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2427 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2427 are further described hereinbelow with reference to Table 1.

[33947] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2427 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33948] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2428 (VGAM2428) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33949] VGAM2428 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2428 was detected is described hereinabove with reference to Figs. 2-8.

[33950] VGAM2428 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.

VGAM2428 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33951] VGAM2428 gene, herein designated VGAM GENE, encodes a VGAM2428 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2428 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2428 precursor RNA is designated SEQ ID:2414, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2414 is located at position 91853 relative to the genome of Goatpox virus.

[33952] VGAM2428 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[33953] An enzyme complex designated DICER COMPLEX, dices the VGAM2428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2428 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2428 RNA is designated SEQ ID:5139, and is provided hereinbelow with reference to the sequence listing part.

[33954] VGAM2428 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33955] VGAM2428 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2428 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33956] The complementary binding of VGAM2428 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2428 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33957] It is appreciated that VGAM2428 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2428 host target genes. The mRNA of each one of this plurality of VGAM2428 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2428 RNA, herein designated VGAM RNA, and which when bound by VGAM2428 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2428 host target proteins.

[33958] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2428 gene, herein designated VGAM GENE, on one or more VGAM2428 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33959] It is yet further appreciated that a function of VGAM2428 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2428 correlate with, and may be deduced from, the identity of the host target genes which VGAM2428 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33960] Nucleotide sequences of the VGAM2428 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2428 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2428 are further described hereinbelow with reference to Table 1.

[33961] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2428 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33962] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2429 (VGAM2429) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33963] VGAM2429 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2429 was detected is described hereinabove with reference to Figs. 2-8.

[33964] VGAM2429 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Goatpox virus. VGAM2429 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33965] VGAM2429 gene, herein designated VGAM GENE, encodes a VGAM2429 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2429 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2429 precursor RNA is designated SEQ ID:2415, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2415 is located at position 58421 relative to the genome of Goatpox virus.

[33966] VGAM2429 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33967] An enzyme complex designated DICER COMPLEX, dices the VGAM2429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2429 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2429 RNA is designated SEQ ID:5140, and is provided hereinbelow with reference to the sequence listing part.

[33968] VGAM2429 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33969] VGAM2429 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2429 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2429 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33970] The complementary binding of VGAM2429 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2429 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33971] It is appreciated that VGAM2429 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2429 host target genes. The mRNA of each one of this plurality of VGAM2429 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2429 RNA, herein designated VGAM RNA, and which when bound by VGAM2429 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2429 host target proteins.

[33972] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2429 gene, herein designated VGAM GENE, on one or more VGAM2429 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33973] It is yet further appreciated that a function of VGAM2429 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2429 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2429 correlate with, and may be deduced from, the identity of the host target genes which VGAM2429 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33974] Nucleotide sequences of the VGAM2429 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2429 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2429 are further described hereinbelow with reference to Table 1.

[33975] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2429 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33976] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2430 (VGAM2430) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33977] VGAM2430 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2430 was detected is described hereinabove with reference to Figs. 2-8.

[33978] VGAM2430 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2430 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33979] VGAM2430 gene, herein designated VGAM GENE, encodes a VGAM2430 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2430 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2430 precursor RNA is designated SEQ ID:2416, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2416 is located at position 123911 relative to the genome of Goatpox virus.

[33980] VGAM2430 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33981] An enzyme complex designated DICER COMPLEX, dices the VGAM2430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2430 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2430 RNA is designated SEQ ID:5141, and is provided hereinbelow with reference to the sequence listing part.

[33982] VGAM2430 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[33983] VGAM2430 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2430 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2430 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[33984] The complementary binding of VGAM2430 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2430 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33985] It is appreciated that VGAM2430 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2430 host target genes. The mRNA of each one of this plurality of VGAM2430 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2430 RNA, herein designated VGAM RNA, and which when bound by VGAM2430 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2430 host target proteins.

[33986] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2430 gene, herein designated VGAM GENE, on one

or more VGAM2430 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[33987] It is yet further appreciated that a function of VGAM2430 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2430 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2430 correlate with, and may be deduced from, the identity of the host target genes which VGAM2430 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33988] Nucleotide sequences of the VGAM2430 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2430 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2430 are further described hereinbelow with reference to Table 1.

[33989] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2430 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33990] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2431 (VGAM2431) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33991] VGAM2431 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2431 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[33992] VGAM2431 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2431 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33993] VGAM2431 gene, herein designated VGAM GENE, encodes a VGAM2431 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2431 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2431 precursor RNA is designated SEQ ID:2417, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2417 is located at position 113097 relative to the genome of Goatpox virus.

[33994] VGAM2431 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33995] An enzyme complex designated DICER COMPLEX, dices the VGAM2431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2431 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2431 RNA is designated SEQ ID:5142, and is provided hereinbelow with reference to the sequence listing part.

[33996] VGAM2431 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[33997] VGAM2431 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2431 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2431 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[33998] The complementary binding of VGAM2431 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2431 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33999] It is appreciated that VGAM2431 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2431 host target genes. The mRNA of each one of this plurality of VGAM2431 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2431 RNA, herein designated VGAM RNA, and which when bound by VGAM2431 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2431 host target proteins.

[34000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2431 gene, herein designated VGAM GENE, on one or more VGAM2431 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34001] It is yet further appreciated that a function of VGAM2431 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2431 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2431 correlate with, and may be deduced from, the identity of the host target genes which VGAM2431 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[34002] Nucleotide sequences of the VGAM2431 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2431 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2431 are further described hereinbelow with reference to Table 1.

[34003] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2431 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34004] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2432 (VGAM2432) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34005] VGAM2432 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2432 was detected is described hereinabove with reference to Figs. 2-8.

[34006] VGAM2432 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2432 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34007] VGAM2432 gene, herein designated VGAM GENE, encodes a VGAM2432 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2432 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2432 precursor RNA is designated SEQ ID:2418, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2418 is located at position 76475 relative to the genome of Goatpox virus.

[34008] VGAM2432 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34009] An enzyme complex designated DICER COMPLEX, dices the VGAM2432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2432 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM2432 RNA is designated SEQ ID:5143, and is provided hereinbelow with reference to the sequence listing part.

[34010] VGAM2432 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2432 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2432 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34011] VGAM2432 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2432 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2432 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2432 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2432 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34012] The complementary binding of VGAM2432 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2432 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2432 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2432 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34013] It is appreciated that VGAM2432 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2432 host target genes. The mRNA of each one of this plurality of VGAM2432 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2432 RNA, herein designated VGAM RNA, and which when bound by VGAM2432 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2432 host target proteins.

[34014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2432 gene, herein designated VGAM GENE, on one or more VGAM2432 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34015] It is yet further appreciated that a function of VGAM2432 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2432 correlate with, and may be deduced from, the identity of the host target genes which VGAM2432 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[34016] Nucleotide sequences of the VGAM2432 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2432 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2432 are further described hereinbelow with reference to Table 1.

[34017] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2432 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34018] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2433 (VGAM2433) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34019] VGAM2433 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2433 was detected is described hereinabove with reference to Figs. 2-8.

[34020] VGAM2433 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2433 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34021] VGAM2433 gene, herein designated VGAM GENE, encodes a VGAM2433 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2433 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2433 precursor RNA is designated SEQ ID:2419, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2419 is located at position 30434 relative to the genome of Goatpox virus.

[34022] VGAM2433 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34023] An enzyme complex designated DICER COMPLEX, dices the VGAM2433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2433 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM2433 RNA is designated SEQ ID:5144, and is provided hereinbelow with reference to the sequence listing part.

[34024] VGAM2433 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34025] VGAM2433 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2433 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34026] The complementary binding of VGAM2433 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2433 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34027] It is appreciated that VGAM2433 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2433 host target genes. The mRNA of each one of this plurality of VGAM2433 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2433 RNA, herein designated VGAM RNA, and which when bound by VGAM2433 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2433 host target proteins.

[34028] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2433 gene, herein designated VGAM GENE, on one or more VGAM2433 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34029] It is yet further appreciated that a function of VGAM2433 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2433 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2433 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34030] Nucleotide sequences of the VGAM2433 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2433 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2433 are further described hereinbelow with reference to Table 1.

[34031] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2433 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34032] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2434 (VGAM2434) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34033] VGAM2434 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2434 was detected is described hereinabove with reference to Figs. 2-8.

[34034] VGAM2434 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2434 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34035] VGAM2434 gene, herein designated VGAM GENE, encodes a VGAM2434 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2434 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2434 precursor RNA is designated SEQ ID:2420, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2420 is located at position 130867 relative to the genome of Goatpox virus.

[34036] VGAM2434 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2434 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34037] An enzyme complex designated DICER COMPLEX, dices the VGAM2434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2434 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2434 RNA is designated SEQ ID:5145, and is provided hereinbelow with reference to the sequence listing part.

[34038] VGAM2434 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2434 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2434 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34039] VGAM2434 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2434 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2434 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2434 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34040] The complementary binding of VGAM2434 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2434 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2434 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2434 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34041] It is appreciated that VGAM2434 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2434 host target genes. The mRNA of each one of this plurality of VGAM2434 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2434 RNA, herein designated VGAM RNA, and which when bound by VGAM2434 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2434 host target proteins.

[34042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2434 gene, herein designated VGAM GENE, on one or more VGAM2434 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34043] It is yet further appreciated that a function of VGAM2434 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2434 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2434 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34044] Nucleotide sequences of the VGAM2434 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2434 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2434 are further described hereinbelow with reference to Table 1.

[34045] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2434 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34046] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2435 (VGAM2435) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[34047] VGAM2435 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2435 was detected is described hereinabove with reference to Figs. 2-8.

[34048] VGAM2435 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2435 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34049] VGAM2435 gene, herein designated VGAM GENE, encodes a VGAM2435 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2435 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2435 precursor RNA is designated SEQ ID:2421, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2421 is located at position 35753 relative to the genome of Goatpox virus.

[34050] VGAM2435 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2435 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34051] An enzyme complex designated DICER COMPLEX, dices the VGAM2435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2435 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2435 RNA is designated SEQ ID:5146, and is provided hereinbelow with reference to the sequence listing part.

[34052] VGAM2435 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2435 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2435 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34053] VGAM2435 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2435 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2435 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2435 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2435 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34054] The complementary binding of VGAM2435 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2435 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2435 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2435 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34055] It is appreciated that VGAM2435 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2435 host target genes. The mRNA of each one of this plurality of VGAM2435 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2435 RNA, herein designated VGAM RNA, and which when bound by VGAM2435 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2435 host target proteins.

[34056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2435 gene, herein designated VGAM GENE, on one or more VGAM2435 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34057] It is yet further appreciated that a function of VGAM2435 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2435 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific

functions, and accordingly utilities, of VGAM2435 correlate with, and may be deduced from, the identity of the host target genes which VGAM2435 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34058] Nucleotide sequences of the VGAM2435 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2435 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2435 are further described hereinbelow with reference to Table 1.

[34059] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2435 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34060] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2436 (VGAM2436) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[34061] VGAM2436 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2436 was detected is described hereinabove with reference to Figs. 2-8.

[34062] VGAM2436 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2436 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34063] VGAM2436 gene, herein designated VGAM GENE, encodes a VGAM2436 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2436 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2436 precursor RNA is designated SEQ ID:2422, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2422 is located at position 79755 relative to the genome of Goatpox virus.

[34064] VGAM2436 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34065] An enzyme complex designated DICER COMPLEX, dices the VGAM2436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2436 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2436 RNA is designated SEQ ID:5147, and is provided hereinbelow with reference to the sequence listing part.

[34066] VGAM2436 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2436 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2436 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34067] VGAM2436 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2436 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2436 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2436 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34068] The complementary binding of VGAM2436 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2436 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2436 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2436 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34069] It is appreciated that VGAM2436 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2436 host target genes. The mRNA of each one of this plurality of VGAM2436 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2436 RNA, herein designated VGAM RNA, and which when bound by VGAM2436 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2436 host target proteins.

[34070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2436 gene, herein designated VGAM GENE, on one or more VGAM2436 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34071] It is yet further appreciated that a function of VGAM2436 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2436 include diagnosis, prevention and

treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2436 correlate with, and may be deduced from, the identity of the host target genes which VGAM2436 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34072] Nucleotide sequences of the VGAM2436 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2436 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2436 are further described hereinbelow with reference to Table 1.

[34073] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2436 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34074] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2437 (VGAM2437) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34075] VGAM2437 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2437 was detected is described hereinabove with reference to Figs. 2-8.

[34076] VGAM2437 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2437 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34077] VGAM2437 gene, herein designated VGAM GENE, encodes a VGAM2437 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2437 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2437 precursor RNA is designated SEQ ID:2423, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2423 is located at position 32976 relative to the genome of Goatpox virus.

[34078] VGAM2437 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34079] An enzyme complex designated DICER COMPLEX, dices the VGAM2437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2437 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2437 RNA is designated SEQ ID:5148, and is provided hereinbelow with reference to the sequence listing part.

[34080] VGAM2437 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34081] VGAM2437 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2437 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2437 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34082] The complementary binding of VGAM2437 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2437 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34083] It is appreciated that VGAM2437 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2437 host target genes. The mRNA of each one of this plurality of VGAM2437 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2437 RNA, herein designated VGAM

RNA, and which when bound by VGAM2437 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2437 host target proteins.

[34084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2437 gene, herein designated VGAM GENE, on one or more VGAM2437 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34085] It is yet further appreciated that a function of VGAM2437 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2437 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2437 correlate with, and may be deduced from, the identity of the host target genes which VGAM2437 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34086] Nucleotide sequences of the VGAM2437 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2437 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2437 are further described hereinbelow with reference to Table 1.

[34087] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2437 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34088] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2438 (VGAM2438) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34089] VGAM2438 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2438 was detected is described hereinabove with reference to Figs. 2-8.

[34090] VGAM2438 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2438 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34091] VGAM2438 gene, herein designated VGAM GENE, encodes a VGAM2438 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2438 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2438 precursor RNA is designated SEQ ID:2424, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2424 is located at position

88305 relative to the genome of Goatpox virus.

[34092] VGAM2438 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34093] An enzyme complex designated DICER COMPLEX, dices the VGAM2438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2438 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2438 RNA is designated SEQ ID:5149, and is provided hereinbelow with reference to the sequence listing part.

[34094] VGAM2438 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34095] VGAM2438 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2438 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34096] The complementary binding of VGAM2438 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2438 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34097] It is appreciated that VGAM2438 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2438 host target genes. The mRNA of each one of this plurality of VGAM2438 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2438 RNA, herein designated VGAM RNA, and which when bound by VGAM2438 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2438 host target proteins.

[34098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2438 gene, herein designated VGAM GENE, on one or more VGAM2438 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34099] It is yet further appreciated that a function of VGAM2438 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2438 correlate with, and may be deduced from, the identity of the host target genes which VGAM2438 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34100] Nucleotide sequences of the VGAM2438 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2438 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2438 are further described hereinbelow with reference to Table 1.

[34101] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2438 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34102] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2439 (VGAM2439) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34103] VGAM2439 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2439 was detected is described hereinabove with reference to Figs. 2-8.

[34104] VGAM2439 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2439 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34105] VGAM2439 gene, herein designated VGAM GENE, encodes a VGAM2439 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2439 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2439 precursor RNA is designated SEQ ID:2425, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2425 is located at position 129653 relative to the genome of Goatpox virus.

[34106] VGAM2439 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34107] An enzyme complex designated DICER COMPLEX, dices the VGAM2439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2439 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2439 RNA is designated SEQ ID:5150, and is provided hereinbelow with reference to the sequence

listing part.

[34108] VGAM2439 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2439 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2439 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34109] VGAM2439 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2439 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2439 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2439 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2439 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34110] The complementary binding of VGAM2439 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2439 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2439 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2439 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34111] It is appreciated that VGAM2439 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2439 host target genes. The mRNA of each one of this plurality of VGAM2439 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2439 RNA, herein designated VGAM RNA, and which when bound by VGAM2439 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2439 host target proteins.

[34112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2439 gene, herein designated VGAM GENE, on one or more VGAM2439 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34113] It is yet further appreciated that a function of VGAM2439

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2439 correlate with, and may be deduced from, the identity of the host target genes which VGAM2439 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34114] Nucleotide sequences of the VGAM2439 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2439 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2439 are further described hereinbelow with reference to Table 1.

[34115] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2439 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34116] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2440 (VGAM2440) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34117] VGAM2440 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2440 was detected is described hereinabove with reference to Figs. 2-8.

[34118] VGAM2440 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2440 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34119] VGAM2440 gene, herein designated VGAM GENE, encodes a VGAM2440 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2440 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2440 precursor RNA is designated SEQ ID:2426, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2426 is located at position 54822 relative to the genome of Goatpox virus.

[34120] VGAM2440 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34121] An enzyme complex designated DICER COMPLEX, dices the VGAM2440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2440 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2440 RNA is designated SEQ ID:5151, and

is provided hereinbelow with reference to the sequence listing part.

[34122] VGAM2440 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34123] VGAM2440 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2440 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2440 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34124] The complementary binding of VGAM2440 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2440 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34125] It is appreciated that VGAM2440 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2440 host target genes. The mRNA of each one of this plurality of VGAM2440 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2440 RNA, herein designated VGAM RNA, and which when bound by VGAM2440 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2440 host target proteins.

[34126] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2440 gene, herein designated VGAM GENE, on one or more VGAM2440 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34127] It is yet further appreciated that a function of VGAM2440 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2440 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2440 correlate with, and may be deduced from, the identity of the host target genes which VGAM2440 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34128] Nucleotide sequences of the VGAM2440 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2440 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2440 are further described hereinbelow with reference to Table 1.

[34129] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2440 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34130] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2441 (VGAM2441) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34131] VGAM2441 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2441 was detected is described hereinabove with reference to Figs. 2-8.

[34132] VGAM2441 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2441 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34133] VGAM2441 gene, herein designated VGAM GENE, encodes a VGAM2441 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2441 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2441 precur-

sor RNA is designated SEQ ID:2427, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2427 is located at position 482 relative to the genome of Goatpox virus.

[34134] VGAM2441 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34135] An enzyme complex designated DICER COMPLEX, dices the VGAM2441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2441 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide se-

quence of VGAM2441 RNA is designated SEQ ID:5152, and is provided hereinbelow with reference to the sequence listing part.

[34136] VGAM2441 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34137] VGAM2441 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2441 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34138] The complementary binding of VGAM2441 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2441 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34139] It is appreciated that VGAM2441 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2441 host target genes. The mRNA of

each one of this plurality of VGAM2441 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2441 RNA, herein designated VGAM RNA, and which when bound by VGAM2441 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2441 host target proteins.

[34140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2441 gene, herein designated VGAM GENE, on one or more VGAM2441 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[34141] It is yet further appreciated that a function of VGAM2441 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2441 correlate with, and may be deduced from, the identity of the host target genes which VGAM2441 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34142] Nucleotide sequences of the VGAM2441 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2441 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2441 are further described hereinbelow with reference to Table 1.

[34143] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2441 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[34144] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2442 (VGAM2442) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34145] VGAM2442 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2442 was detected is described hereinabove with reference to Figs. 2-8.

[34146] VGAM2442 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.
VGAM2442 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34147] VGAM2442 gene, herein designated VGAM GENE, encodes a VGAM2442 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2442 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2442 precursor RNA is designated SEQ ID:2428, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2428 is located at position 110320 relative to the genome of Goatpox virus.

[34148] VGAM2442 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34149] An enzyme complex designated DICER COMPLEX, dices the VGAM2442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2442 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2442 RNA is designated SEQ ID:5153, and is provided hereinbelow with reference to the sequence listing part.

[34150] VGAM2442 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34151] VGAM2442 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2442 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2442 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34152] The complementary binding of VGAM2442 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2442 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34153] It is appreciated that VGAM2442 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2442 host target genes. The mRNA of each one of this plurality of VGAM2442 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2442 RNA, herein designated VGAM RNA, and which when bound by VGAM2442 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2442 host target proteins.

[34154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2442 gene, herein designated VGAM GENE, on one or more VGAM2442 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34155] It is yet further appreciated that a function of VGAM2442 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2442 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2442 correlate with, and may be deduced from, the identity of the host target genes which VGAM2442 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34156] Nucleotide sequences of the VGAM2442 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2442 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2442 are further described hereinbelow with reference to Table 1.

[34157] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2442 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34158] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2443 (VGAM2443) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34159] VGAM2443 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2443 was detected is described hereinabove with reference to Figs. 2-8.

[34160] VGAM2443 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2443 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34161] VGAM2443 gene, herein designated VGAM GENE, encodes a VGAM2443 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2443 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2443 precursor RNA is designated SEQ ID:2429, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2429 is located at position 167632 relative to the genome of Mouse cytomegalovirus 1.

[34162] VGAM2443 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34163] An enzyme complex designated DICER COMPLEX, dices the VGAM2443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2443 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2443 RNA is designated SEQ ID:5154, and is provided hereinbelow with reference to the sequence listing part.

[34164] VGAM2443 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34165] VGAM2443 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2443 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34166] The complementary binding of VGAM2443 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2443 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34167] It is appreciated that VGAM2443 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2443 host target genes. The mRNA of each one of this plurality of VGAM2443 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2443 RNA, herein designated VGAM RNA, and which when bound by VGAM2443 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2443 host target proteins.

[34168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2443 gene, herein designated VGAM GENE, on one or more VGAM2443 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34169] It is yet further appreciated that a function of VGAM2443 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2443 correlate with, and may be deduced from, the identity of the host target genes which VGAM2443 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34170] Nucleotide sequences of the VGAM2443 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2443 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2443 are further described hereinbelow with reference to Table 1.

[34171] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2443 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34172] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2444 (VGAM2444) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34173] VGAM2444 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2444 was detected is described hereinabove with reference to Figs. 2-8.

[34174] VGAM2444 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2444 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34175] VGAM2444 gene, herein designated VGAM GENE, encodes a VGAM2444 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2444 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2444 precursor RNA is designated SEQ ID:2430, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2430 is located at position 180574 relative to the genome of Mouse cytomegalovirus 1.

[34176] VGAM2444 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34177] An enzyme complex designated DICER COMPLEX, dices the VGAM2444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2444 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM2444 RNA is designated SEQ ID:5155, and is provided hereinbelow with reference to the sequence listing part.

[34178] VGAM2444 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34179] VGAM2444 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2444 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2444 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34180] The complementary binding of VGAM2444 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2444 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34181] It is appreciated that VGAM2444 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2444 host target genes. The mRNA of each one of this plurality of VGAM2444 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2444 RNA, herein designated VGAM RNA, and which when bound by VGAM2444 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2444 host target proteins.

[34182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2444 gene, herein designated VGAM GENE, on one or more VGAM2444 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34183] It is yet further appreciated that a function of VGAM2444 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2444 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2444 correlate with, and may be deduced from, the identity of the host target genes which VGAM2444 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34184] Nucleotide sequences of the VGAM2444 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2444 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2444 are further described hereinbelow with reference to Table 1.

[34185] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2444 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34186] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2445 (VGAM2445) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34187] VGAM2445 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2445 was detected is described hereinabove with reference to Figs. 2-8.

[34188] VGAM2445 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2445 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34189] VGAM2445 gene, herein designated VGAM GENE, encodes

a VGAM2445 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2445 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2445 precursor RNA is designated SEQ ID:2431, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2431 is located at position 13050 relative to the genome of Mouse cytomegalovirus 1.

[34190] VGAM2445 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34191] An enzyme complex designated DICER COMPLEX, dices the VGAM2445 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2445 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2445 RNA is designated SEQ ID:5156, and is provided hereinbelow with reference to the sequence listing part.

[34192] VGAM2445 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2445 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2445 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34193] VGAM2445 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2445 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2445 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2445 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2445 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34194] The complementary binding of VGAM2445 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2445 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2445

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2445 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34195] It is appreciated that VGAM2445 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2445 host target genes. The mRNA of each one of this plurality of VGAM2445 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2445 RNA, herein designated VGAM RNA, and which when bound by VGAM2445 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2445 host target proteins.

[34196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2445 gene, herein designated VGAM GENE, on one or more VGAM2445 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34197] It is yet further appreciated that a function of VGAM2445 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2445 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2445 correlate with, and may be deduced from, the identity of the host target genes which VGAM2445 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34198] Nucleotide sequences of the VGAM2445 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2445 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2445 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2445 are further described hereinbelow with reference to Table 1.

[34199] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2445 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34200] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2446 (VGAM2446) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34201] VGAM2446 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2446 was detected is described hereinabove with reference to Figs. 2-8.

[34202] VGAM2446 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2446 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[34203] VGAM2446 gene, herein designated VGAM GENE, encodes a VGAM2446 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2446 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2446 precursor RNA is designated SEQ ID:2432, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2432 is located at position 159425 relative to the genome of Mouse cytomegalovirus 1.

[34204] VGAM2446 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34205] An enzyme complex designated DICER COMPLEX, dices the VGAM2446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2446 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2446 RNA is designated SEQ ID:5157, and is provided hereinbelow with reference to the sequence listing part.

[34206] VGAM2446 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2446 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2446 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34207] VGAM2446 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2446 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2446 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2446 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2446 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34208] The complementary binding of VGAM2446 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2446 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2446 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2446 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34209] It is appreciated that VGAM2446 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2446 host target genes. The mRNA of each one of this plurality of VGAM2446 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2446 RNA, herein designated VGAM RNA, and which when bound by VGAM2446 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2446 host target proteins.

[34210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2446 gene, herein designated VGAM GENE, on one or more VGAM2446 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34211] It is yet further appreciated that a function of VGAM2446 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2446 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2446 correlate with, and may be deduced from, the identity of the host target genes which VGAM2446 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34212] Nucleotide sequences of the VGAM2446 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2446 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2446 are further described hereinbelow with reference to Table 1.

[34213] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2446 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34214] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2447 (VGAM2447) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34215] VGAM2447 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2447 was detected is described hereinabove with reference to Figs. 2-8.

[34216] VGAM2447 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus

1. VGAM2447 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34217] VGAM2447 gene, herein designated VGAM GENE, encodes a VGAM2447 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2447 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2447 precursor RNA is designated SEQ ID:2433, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2433 is located at position 2867 relative to the genome of Mouse cytomegalovirus 1.

[34218] VGAM2447 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[34219] An enzyme complex designated DICER COMPLEX, dices the VGAM2447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2447 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2447 RNA is designated SEQ ID:5158, and is provided hereinbelow with reference to the sequence listing part.

[34220] VGAM2447 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34221] VGAM2447 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2447 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2447 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34222] The complementary binding of VGAM2447 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2447 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34223] It is appreciated that VGAM2447 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2447 host target genes. The mRNA of each one of this plurality of VGAM2447 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2447 RNA, herein designated VGAM RNA, and which when bound by VGAM2447 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2447 host target proteins.

[34224] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2447 gene, herein designated VGAM GENE, on one or more VGAM2447 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34225] It is yet further appreciated that a function of VGAM2447 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2447 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2447 correlate with, and may be deduced from, the identity of the host target genes which VGAM2447 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34226] Nucleotide sequences of the VGAM2447 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2447 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2447 are further described hereinbelow with reference to Table 1.

[34227] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2447 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34228] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2448 (VGAM2448) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34229] VGAM2448 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2448 was detected is described hereinabove with reference to Figs. 2-8.

[34230] VGAM2448 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Mouse cytomegalovirus 1. VGAM2448 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34231] VGAM2448 gene, herein designated VGAM GENE, encodes a VGAM2448 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2448 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2448 precursor RNA is designated SEQ ID:2434, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2434 is located at position 134478 relative to the genome of Mouse cytomegalovirus 1.

[34232] VGAM2448 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34233] An enzyme complex designated DICER COMPLEX, dices the VGAM2448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2448 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2448 RNA is designated SEQ ID:5159, and is provided hereinbelow with reference to the sequence listing part.

[34234] VGAM2448 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[34235] VGAM2448 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2448 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2448 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34236] The complementary binding of VGAM2448 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2448 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34237] It is appreciated that VGAM2448 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2448 host target genes. The mRNA of each one of this plurality of VGAM2448 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2448 RNA, herein designated VGAM RNA, and which when bound by VGAM2448 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2448 host target proteins.

[34238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2448 gene, herein designated VGAM GENE, on one

or more VGAM2448 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34239] It is yet further appreciated that a function of VGAM2448 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2448 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2448 correlate with, and may be deduced from, the identity of the host target genes which VGAM2448 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34240] Nucleotide sequences of the VGAM2448 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2448 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2448 are further described hereinbelow with reference to Table 1.

[34241] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2448 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34242] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2449 (VGAM2449) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34243] VGAM2449 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2449 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[34244] VGAM2449 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2449 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34245] VGAM2449 gene, herein designated VGAM GENE, encodes a VGAM2449 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2449 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2449 precursor RNA is designated SEQ ID:2435, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2435 is located at position 53100 relative to the genome of Mouse cytomegalovirus 1.

[34246] VGAM2449 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34247] An enzyme complex designated DICER COMPLEX, dices the VGAM2449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2449 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2449 RNA is designated SEQ ID:5160, and is provided hereinbelow with reference to the sequence listing part.

[34248] VGAM2449 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34249] VGAM2449 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2449 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34250] The complementary binding of VGAM2449 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2449 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34251] It is appreciated that VGAM2449 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2449 host target genes. The mRNA of each one of this plurality of VGAM2449 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2449 RNA, herein designated VGAM RNA, and which when bound by VGAM2449 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2449 host target proteins.

[34252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2449 gene, herein designated VGAM GENE, on one or more VGAM2449 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34253] It is yet further appreciated that a function of VGAM2449 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2449 correlate with, and may be deduced from, the identity of the host target genes which VGAM2449 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[34254] Nucleotide sequences of the VGAM2449 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2449 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2449 are further described hereinbelow with reference to Table 1.

[34255] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2449 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34256] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2450 (VGAM2450) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34257] VGAM2450 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2450 was detected is described hereinabove with reference to Figs. 2-8.

[34258] VGAM2450 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2450 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34259] VGAM2450 gene, herein designated VGAM GENE, encodes a VGAM2450 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2450 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2450 precursor RNA is designated SEQ ID:2436, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2436 is located at position 39437 relative to the genome of Mouse cytomegalovirus 1.

[34260] VGAM2450 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2450 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34261] An enzyme complex designated DICER COMPLEX, dices the VGAM2450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2450 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2450 RNA is designated SEQ ID:5161, and is provided hereinbelow with reference to the sequence listing part.

[34262] VGAM2450 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2450 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2450 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34263] VGAM2450 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2450 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2450 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2450 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2450 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34264] The complementary binding of VGAM2450 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2450 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2450 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2450 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34265] It is appreciated that VGAM2450 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2450 host target genes. The mRNA of each one of this plurality of VGAM2450 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2450 RNA, herein designated VGAM RNA, and which when bound by VGAM2450 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2450 host target proteins.

[34266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2450 gene, herein designated VGAM GENE, on one or more VGAM2450 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34267] It is yet further appreciated that a function of VGAM2450 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2450 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2450

correlate with, and may be deduced from, the identity of the host target genes which VGAM2450 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34268] Nucleotide sequences of the VGAM2450 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2450 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2450 are further described hereinbelow with reference to Table 1.

[34269] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2450 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34270] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2451 (VGAM2451) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[34271] VGAM2451 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2451 was detected is described hereinabove with reference to Figs. 2-8.

[34272] VGAM2451 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2451 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34273] VGAM2451 gene, herein designated VGAM GENE, encodes a VGAM2451 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2451 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2451 precursor RNA is designated SEQ ID:2437, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2437 is located at position 43825 relative to the genome of Mouse cytomegalovirus 1.

[34274] VGAM2451 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34275] An enzyme complex designated DICER COMPLEX, dices the VGAM2451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2451 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2451 RNA is designated SEQ ID:5162, and is provided hereinbelow with reference to the sequence listing part.

[34276] VGAM2451 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2451 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2451 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34277] VGAM2451 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2451 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2451 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2451 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2451 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34278] The complementary binding of VGAM2451 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2451 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2451 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2451 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34279] It is appreciated that VGAM2451 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2451 host target genes. The mRNA of each one of this plurality of VGAM2451 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2451 RNA, herein designated VGAM RNA, and which when bound by VGAM2451 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2451 host target proteins.

[34280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2451 gene, herein designated VGAM GENE, on one or more VGAM2451 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34281] It is yet further appreciated that a function of VGAM2451 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2451 include diagnosis, prevention and

treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2451 correlate with, and may be deduced from, the identity of the host target genes which VGAM2451 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34282] Nucleotide sequences of the VGAM2451 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2451 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2451 are further described hereinbelow with reference to Table 1.

[34283] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2451 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34284] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2452 (VGAM2452) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34285] VGAM2452 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2452 was detected is described hereinabove with reference to Figs. 2-8.

[34286] VGAM2452 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2452 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34287] VGAM2452 gene, herein designated VGAM GENE, encodes a VGAM2452 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2452 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2452 precursor RNA is designated SEQ ID:2438, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2438 is located at position 150242 relative to the genome of Mouse cytomegalovirus

1.

[34288] VGAM2452 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34289] An enzyme complex designated DICER COMPLEX, dices the VGAM2452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2452 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2452 RNA is designated SEQ ID:5163, and is provided hereinbelow with reference to the sequence listing part.

[34290] VGAM2452 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2452 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2452 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34291] VGAM2452 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2452 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2452 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2452 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34292] The complementary binding of VGAM2452 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2452 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2452 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2452 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34293] It is appreciated that VGAM2452 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2452 host target genes. The mRNA of each one of this plurality of VGAM2452 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2452 RNA, herein designated VGAM RNA, and which when bound by VGAM2452 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2452 host target proteins.

[34294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2452 gene, herein designated VGAM GENE, on one or more VGAM2452 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34295] It is yet further appreciated that a function of VGAM2452 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2452 correlate with, and may be deduced from, the identity of the host target genes which VGAM2452 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34296] Nucleotide sequences of the VGAM2452 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2452 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2452 are further described hereinbelow with reference to Table 1.

[34297] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2452 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34298] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2453 (VGAM2453) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34299] VGAM2453 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2453 was detected is described hereinabove with reference to Figs. 2-8.

[34300] VGAM2453 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2453 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34301] VGAM2453 gene, herein designated VGAM GENE, encodes a VGAM2453 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2453 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2453 precursor RNA is designated SEQ ID:2439, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2439 is located at position 45147 relative to the genome of Mouse cytomegalovirus 1.

[34302] VGAM2453 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34303] An enzyme complex designated DICER COMPLEX, dices the VGAM2453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2453 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2453 RNA is designated SEQ ID:5164, and

is provided hereinbelow with reference to the sequence listing part.

[34304] VGAM2453 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34305] VGAM2453 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2453 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2453 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34306] The complementary binding of VGAM2453 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2453 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34307] It is appreciated that VGAM2453 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2453 host target genes. The mRNA of each one of this plurality of VGAM2453 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2453 RNA, herein designated VGAM RNA, and which when bound by VGAM2453 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2453 host target proteins.

[34308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2453 gene, herein designated VGAM GENE, on one or more VGAM2453 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34309] It is yet further appreciated that a function of VGAM2453 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2453 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2453 correlate with, and may be deduced from, the identity of the host target genes which VGAM2453 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34310] Nucleotide sequences of the VGAM2453 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2453 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2453 are further described hereinbelow with reference to Table 1.

[34311] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2453 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34312] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2454 (VGAM2454) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34313] VGAM2454 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2454 was detected is described hereinabove with reference to Figs. 2-8.

[34314] VGAM2454 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2454 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34315] VGAM2454 gene, herein designated VGAM GENE, encodes a VGAM2454 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2454 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2454 precur-

sor RNA is designated SEQ ID:2440, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2440 is located at position 170592 relative to the genome of Mouse cytomegalovirus 1.

[34316] VGAM2454 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34317] An enzyme complex designated DICER COMPLEX, dices the VGAM2454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2454 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2454 RNA is designated SEQ ID:5165, and is provided hereinbelow with reference to the sequence listing part.

[34318] VGAM2454 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34319] VGAM2454 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2454 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34320] The complementary binding of VGAM2454 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2454 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34321] It is appreciated that VGAM2454 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2454 host target genes. The mRNA of each one of this plurality of VGAM2454 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2454 RNA, herein designated VGAM RNA, and which when bound by VGAM2454 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2454 host target proteins.

[34322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2454 gene, herein designated VGAM GENE, on one or more VGAM2454 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34323] It is yet further appreciated that a function of VGAM2454 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2454 correlate with, and may be deduced from, the identity of the host target genes which VGAM2454 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34324] Nucleotide sequences of the VGAM2454 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2454 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2454 are further described hereinbelow with reference to Table 1.

[34325] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2454 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34326] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2455 (VGAM2455) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34327] VGAM2455 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2455 was detected is described hereinabove with reference to Figs. 2-8.

[34328] VGAM2455 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2455 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34329] VGAM2455 gene, herein designated VGAM GENE, encodes a VGAM2455 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2455 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2455 precursor RNA is designated SEQ ID:2441, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2441 is located at position 3102 relative to the genome of Mouse cytomegalovirus 1.

[34330] VGAM2455 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34331] An enzyme complex designated DICER COMPLEX, dices the VGAM2455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2455 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2455 RNA is designated SEQ ID:5166, and is provided hereinbelow with reference to the sequence listing part.

[34332] VGAM2455 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34333] VGAM2455 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2455 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2455 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34334] The complementary binding of VGAM2455 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2455 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34335] It is appreciated that VGAM2455 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2455 host target genes. The mRNA of each one of this plurality of VGAM2455 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2455 RNA, herein designated VGAM RNA, and which when bound by VGAM2455 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2455 host target proteins.

[34336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2455 gene, herein designated VGAM GENE, on one or more VGAM2455 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34337] It is yet further appreciated that a function of VGAM2455 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2455 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2455 correlate with, and may be deduced from, the identity of the host target genes which VGAM2455 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34338] Nucleotide sequences of the VGAM2455 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2455 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2455 are further described hereinbelow with reference to Table 1.

[34339] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2455 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34340] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2456 (VGAM2456) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34341] VGAM2456 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2456 was detected is described hereinabove with reference to Figs. 2-8.

[34342] VGAM2456 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2456 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34343] VGAM2456 gene, herein designated VGAM GENE, encodes a VGAM2456 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2456 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2456 precursor RNA is designated SEQ ID:2442, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2442 is located at position 166990 relative to the genome of Mouse cytomegalovirus 1.

[34344] VGAM2456 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34345] An enzyme complex designated DICER COMPLEX, dices the VGAM2456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2456 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2456 RNA is designated SEQ ID:5167, and is provided hereinbelow with reference to the sequence listing part.

[34346] VGAM2456 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2456 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2456 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34347] VGAM2456 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2456 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2456 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2456 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2456 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34348] The complementary binding of VGAM2456 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2456 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2456 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2456 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[34349] It is appreciated that VGAM2456 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2456 host target genes. The mRNA of each one of this plurality of VGAM2456 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2456 RNA, herein designated VGAM RNA, and which when bound by VGAM2456 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2456 host target proteins.

[34350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2456 gene, herein designated VGAM GENE, on one or more VGAM2456 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34351] It is yet further appreciated that a function of VGAM2456 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2456 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2456 correlate with, and may be deduced from, the identity of the host target genes which VGAM2456 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34352] Nucleotide sequences of the VGAM2456 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2456 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2456 are further described hereinbelow with reference to Table 1.

[34353] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2456 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34354] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2457 (VGAM2457) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34355] VGAM2457 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2457 was detected is described hereinabove with reference to Figs. 2-8.

[34356] VGAM2457 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2457 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34357] VGAM2457 gene, herein designated VGAM GENE, encodes a VGAM2457 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2457 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2457 precursor RNA is designated SEQ ID:2443, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2443 is located at position 49086 relative to the genome of Mouse cytomegalovirus 1.

[34358] VGAM2457 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34359] An enzyme complex designated DICER COMPLEX, dices the VGAM2457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2457 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2457 RNA is designated SEQ ID:5168, and is provided hereinbelow with reference to the sequence listing part.

[34360] VGAM2457 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2457 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2457 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34361] VGAM2457 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2457 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2457 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2457 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34362] The complementary binding of VGAM2457 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2457 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2457 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2457 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34363] It is appreciated that VGAM2457 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2457 host target genes. The mRNA of each one of this plurality of VGAM2457 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2457 RNA, herein designated VGAM RNA, and which when bound by VGAM2457 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2457 host target proteins.

[34364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2457 gene, herein designated VGAM GENE, on one or more VGAM2457 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34365] It is yet further appreciated that a function of VGAM2457 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2457 correlate with, and may be deduced from, the identity of the host target genes which VGAM2457 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34366] Nucleotide sequences of the VGAM2457 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2457 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2457 are further

described hereinbelow with reference to Table 1.

[34367] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2457 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34368] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2458 (VGAM2458) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34369] VGAM2458 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2458 was detected is described hereinabove with reference to Figs. 2-8.

[34370] VGAM2458 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2458 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34371] VGAM2458 gene, herein designated VGAM GENE, encodes a VGAM2458 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2458 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2458 precursor RNA is designated SEQ ID:2444, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2444 is located at position 183475 relative to the genome of Mouse cytomegalovirus 1.

[34372] VGAM2458 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34373] An enzyme complex designated DICER COMPLEX, dices

the VGAM2458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2458 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2458 RNA is designated SEQ ID:5169, and is provided hereinbelow with reference to the sequence listing part.

[34374] VGAM2458 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2458 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2458 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34375] VGAM2458 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2458 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2458 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2458 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2458 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34376] The complementary binding of VGAM2458 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2458 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2458 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2458 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34377] It is appreciated that VGAM2458 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2458 host target genes. The mRNA of each one of this plurality of VGAM2458 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2458 RNA, herein designated VGAM RNA, and which when bound by VGAM2458 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2458 host target proteins.

[34378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2458 gene, herein designated VGAM GENE, on one or more VGAM2458 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34379] It is yet further appreciated that a function of VGAM2458 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2458 correlate with, and may be deduced from, the identity of the host target genes which VGAM2458 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34380] Nucleotide sequences of the VGAM2458 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2458 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2458 are further described hereinbelow with reference to Table 1.

[34381] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2458 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34382] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2459 (VGAM2459) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34383] VGAM2459 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2459 was detected is described hereinabove with reference to Figs. 2-8.

[34384] VGAM2459 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2459 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[34385] VGAM2459 gene, herein designated VGAM GENE, encodes a VGAM2459 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2459 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2459 precursor RNA is designated SEQ ID:2445, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2445 is located at position 121309 relative to the genome of Mouse cytomegalovirus 1.

[34386] VGAM2459 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[34387] An enzyme complex designated DICER COMPLEX, dices the VGAM2459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2459 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2459 RNA is designated SEQ ID:5170, and is provided hereinbelow with reference to the sequence listing part.

[34388] VGAM2459 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2459 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2459 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34389] VGAM2459 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2459 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2459 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2459 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34390] The complementary binding of VGAM2459 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2459 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2459 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2459 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34391] It is appreciated that VGAM2459 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2459 host target genes. The mRNA of each one of this plurality of VGAM2459 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2459 RNA, herein designated VGAM RNA, and which when bound by VGAM2459 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2459 host target proteins.

[34392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2459 gene, herein designated VGAM GENE, on one or more VGAM2459 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34393] It is yet further appreciated that a function of VGAM2459 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2459 correlate with, and may be deduced from, the identity of the host target genes which VGAM2459 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34394] Nucleotide sequences of the VGAM2459 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2459 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2459 are further described hereinbelow with reference to Table 1.

[34395] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2459 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34396] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2460 (VGAM2460) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34397] VGAM2460 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2460 was detected is described hereinabove with reference to Figs. 2-8.

[34398] VGAM2460 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Mouse cytomegalovirus 1. VGAM2460 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34399] VGAM2460 gene, herein designated VGAM GENE, encodes a VGAM2460 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2460 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2460 precursor RNA is designated SEQ ID:2446, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2446 is located at position 17895 relative to the genome of Mouse cytomegalovirus 1.

[34400] VGAM2460 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34401] An enzyme complex designated DICER COMPLEX, dices the VGAM2460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2460 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2460 RNA is designated SEQ ID:5171, and is provided hereinbelow with reference to the sequence listing part.

[34402] VGAM2460 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[34403] VGAM2460 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2460 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2460 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34404] The complementary binding of VGAM2460 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2460 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34405] It is appreciated that VGAM2460 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2460 host target genes. The mRNA of each one of this plurality of VGAM2460 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2460 RNA, herein designated VGAM RNA, and which when bound by VGAM2460 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2460 host target proteins.

[34406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2460 gene, herein designated VGAM GENE, on one

or more VGAM2460 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34407] It is yet further appreciated that a function of VGAM2460 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2460 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2460 correlate with, and may be deduced from, the identity of the host target genes which VGAM2460 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34408] Nucleotide sequences of the VGAM2460 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2460 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2460 are further described hereinbelow with reference to Table 1.

[34409] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2460 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34410] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2461 (VGAM2461) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34411] VGAM2461 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2461 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[34412] VGAM2461 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2461 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34413] VGAM2461 gene, herein designated VGAM GENE, encodes a VGAM2461 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2461 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2461 precursor RNA is designated SEQ ID:2447, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2447 is located at position 219567 relative to the genome of Mouse cytomegalovirus 1.

[34414] VGAM2461 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34415] An enzyme complex designated DICER COMPLEX, dices the VGAM2461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2461 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2461 RNA is designated SEQ ID:5172, and is provided hereinbelow with reference to the sequence listing part.

[34416] VGAM2461 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34417] VGAM2461 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2461 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34418] The complementary binding of VGAM2461 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2461 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34419] It is appreciated that VGAM2461 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2461 host target genes. The mRNA of each one of this plurality of VGAM2461 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2461 RNA, herein designated VGAM RNA, and which when bound by VGAM2461 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2461 host target proteins.

[34420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2461 gene, herein designated VGAM GENE, on one or more VGAM2461 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34421] It is yet further appreciated that a function of VGAM2461 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2461 correlate with, and may be deduced from, the identity of the host target genes which VGAM2461 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[34422] Nucleotide sequences of the VGAM2461 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2461 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2461 are further described hereinbelow with reference to Table 1.

[34423] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2461 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34424] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2462 (VGAM2462) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34425] VGAM2462 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2462 was detected is described hereinabove with reference to Figs. 2-8.

[34426] VGAM2462 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2462 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34427] VGAM2462 gene, herein designated VGAM GENE, encodes a VGAM2462 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2462 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2462 precursor RNA is designated SEQ ID:2448, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2448 is located at position 164 relative to the genome of Mouse cytomegalovirus 1.

[34428] VGAM2462 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34429] An enzyme complex designated DICER COMPLEX, dices the VGAM2462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2462 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2462 RNA is designated SEQ ID:5173, and is provided hereinbelow with reference to the sequence listing part.

[34430] VGAM2462 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34431] VGAM2462 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2462 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2462 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34432] The complementary binding of VGAM2462 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2462 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34433] It is appreciated that VGAM2462 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2462 host target genes. The mRNA of each one of this plurality of VGAM2462 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2462 RNA, herein designated VGAM RNA, and which when bound by VGAM2462 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2462 host target proteins.

[34434] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2462 gene, herein designated VGAM GENE, on one or more VGAM2462 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34435] It is yet further appreciated that a function of VGAM2462 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2462 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2462 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2462 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34436] Nucleotide sequences of the VGAM2462 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2462 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2462 are further described hereinbelow with reference to Table 1.

[34437] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2462 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34438] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2463 (VGAM2463) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34439] VGAM2463 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2463 was detected is described hereinabove with reference to Figs. 2-8.

[34440] VGAM2463 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2463 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34441] VGAM2463 gene, herein designated VGAM GENE, encodes a VGAM2463 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2463 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2463 precursor RNA is designated SEQ ID:2449, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2449 is located at position 225478 relative to the genome of Mouse cytomegalovirus 1.

[34442] VGAM2463 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2463 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34443] An enzyme complex designated DICER COMPLEX, dices the VGAM2463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2463 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2463 RNA is designated SEQ ID:5174, and is provided hereinbelow with reference to the sequence listing part.

[34444] VGAM2463 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2463 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2463 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34445] VGAM2463 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2463 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2463 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2463 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34446] The complementary binding of VGAM2463 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2463 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2463 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2463 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34447] It is appreciated that VGAM2463 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2463 host target genes. The mRNA of each one of this plurality of VGAM2463 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2463 RNA, herein designated VGAM RNA, and which when bound by VGAM2463 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2463 host target proteins.

[34448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2463 gene, herein designated VGAM GENE, on one or more VGAM2463 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34449] It is yet further appreciated that a function of VGAM2463 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2463 correlate with, and may be deduced from, the identity of the host target genes which VGAM2463 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34450] Nucleotide sequences of the VGAM2463 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2463 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2463 are further described hereinbelow with reference to Table 1.

[34451] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2463 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34452] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2464 (VGAM2464) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[34453] VGAM2464 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2464 was detected is described hereinabove with reference to Figs. 2-8.

[34454] VGAM2464 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2464 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34455] VGAM2464 gene, herein designated VGAM GENE, encodes a VGAM2464 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2464 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2464 precursor RNA is designated SEQ ID:2450, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2450 is located at position 225307 relative to the genome of Mouse cytomegalovirus 1.

[34456] VGAM2464 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34457] An enzyme complex designated DICER COMPLEX, dices the VGAM2464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2464 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2464 RNA is designated SEQ ID:5175, and is provided hereinbelow with reference to the sequence listing part.

[34458] VGAM2464 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34459] VGAM2464 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2464 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34460] The complementary binding of VGAM2464 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2464 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34461] It is appreciated that VGAM2464 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2464 host target genes. The mRNA of each one of this plurality of VGAM2464 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2464 RNA, herein designated VGAM

RNA, and which when bound by VGAM2464 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2464 host target proteins.

[34462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2464 gene, herein designated VGAM GENE, on one or more VGAM2464 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34463] It is yet further appreciated that a function of VGAM2464 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2464 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2464 correlate with, and may be deduced from, the identity of the host target genes which VGAM2464 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34464] Nucleotide sequences of the VGAM2464 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2464 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2464 are further described hereinbelow with reference to Table 1.

[34465] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2464 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34466] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2465 (VGAM2465) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34467] VGAM2465 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2465 was detected is described hereinabove with reference to Figs. 2-8.

[34468] VGAM2465 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2465 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34469] VGAM2465 gene, herein designated VGAM GENE, encodes a VGAM2465 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2465 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2465 precursor RNA is designated SEQ ID:2451, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2451 is located at position

161125 relative to the genome of Mouse cytomegalovirus 1.

[34470] VGAM2465 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34471] An enzyme complex designated DICER COMPLEX, dices the VGAM2465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2465 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2465 RNA is designated SEQ ID:5176, and is provided hereinbelow with reference to the sequence

listing part.

[34472] VGAM2465 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34473] VGAM2465 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2465 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2465 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34474] The complementary binding of VGAM2465 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2465 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34475] It is appreciated that VGAM2465 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2465 host target genes. The mRNA of each one of this plurality of VGAM2465 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2465 RNA, herein designated VGAM RNA, and which when bound by VGAM2465 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2465 host target proteins.

[34476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2465 gene, herein designated VGAM GENE, on one or more VGAM2465 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34477] It is yet further appreciated that a function of VGAM2465

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2465 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2465 correlate with, and may be deduced from, the identity of the host target genes which VGAM2465 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34478] Nucleotide sequences of the VGAM2465 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2465 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2465 are further described hereinbelow with reference to Table 1.

[34479] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2465 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34480] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2466 (VGAM2466) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34481] VGAM2466 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2466 was detected is described hereinabove with reference to Figs. 2-8.

[34482] VGAM2466 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2466 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34483] VGAM2466 gene, herein designated VGAM GENE, encodes a VGAM2466 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2466 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2466 precursor RNA is designated SEQ ID:2452, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2452 is located at position 94468 relative to the genome of Mouse cytomegalovirus 1.

[34484] VGAM2466 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34485] An enzyme complex designated DICER COMPLEX, dices the VGAM2466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2466 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide se-

quence of VGAM2466 RNA is designated SEQ ID:5177, and is provided hereinbelow with reference to the sequence listing part.

[34486] VGAM2466 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34487] VGAM2466 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2466 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34488] The complementary binding of VGAM2466 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2466 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34489] It is appreciated that VGAM2466 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2466 host target genes. The mRNA of

each one of this plurality of VGAM2466 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2466 RNA, herein designated VGAM RNA, and which when bound by VGAM2466 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2466 host target proteins.

[34490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2466 gene, herein designated VGAM GENE, on one or more VGAM2466 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[34491] It is yet further appreciated that a function of VGAM2466 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2466 correlate with, and may be deduced from, the identity of the host target genes which VGAM2466 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34492] Nucleotide sequences of the VGAM2466 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2466 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2466 are further described hereinbelow with reference to Table 1.

[34493] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2466 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[34494] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2467 (VGAM2467) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34495] VGAM2467 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2467 was detected is described hereinabove with reference to Figs. 2-8.

[34496] VGAM2467 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2467 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34497] VGAM2467 gene, herein designated VGAM GENE, encodes a VGAM2467 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2467 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2467 precursor RNA is designated SEQ ID:2453, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2453 is located at position 175100 relative to the genome of Mouse cytomegalovirus 1.

[34498] VGAM2467 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34499] An enzyme complex designated DICER COMPLEX, dices the VGAM2467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2467 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2467 RNA is designated SEQ ID:5178, and is provided hereinbelow with reference to the sequence listing part.

[34500] VGAM2467 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34501] VGAM2467 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2467 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2467 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34502] The complementary binding of VGAM2467 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2467 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34503] It is appreciated that VGAM2467 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2467 host target genes. The mRNA of each one of this plurality of VGAM2467 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2467 RNA, herein designated VGAM RNA, and which when bound by VGAM2467 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2467 host target proteins.

[34504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2467 gene, herein designated VGAM GENE, on one or more VGAM2467 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34505] It is yet further appreciated that a function of VGAM2467 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2467 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2467 correlate with, and may be deduced from, the identity of the host target genes which VGAM2467 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34506] Nucleotide sequences of the VGAM2467 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2467 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2467 are further described hereinbelow with reference to Table 1.

[34507] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2467 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34508] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2468 (VGAM2468) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34509] VGAM2468 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2468 was detected is described hereinabove with reference to Figs. 2-8.

[34510] VGAM2468 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2468 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34511] VGAM2468 gene, herein designated VGAM GENE, encodes a VGAM2468 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2468 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2468 precursor RNA is designated SEQ ID:2454, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2454 is located at position 64210 relative to the genome of Mouse cytomegalovirus 1.

[34512] VGAM2468 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34513] An enzyme complex designated DICER COMPLEX, dices the VGAM2468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2468 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2468 RNA is designated SEQ ID:5179, and is provided hereinbelow with reference to the sequence listing part.

[34514] VGAM2468 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2468 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2468 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34515] VGAM2468 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2468 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2468 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2468 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34516] The complementary binding of VGAM2468 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2468 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2468 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2468 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[34517] It is appreciated that VGAM2468 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2468 host target genes. The mRNA of each one of this plurality of VGAM2468 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2468 RNA, herein designated VGAM RNA, and which when bound by VGAM2468 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2468 host target proteins.

[34518] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2468 gene, herein designated VGAM GENE, on one or more VGAM2468 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34519] It is yet further appreciated that a function of VGAM2468 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2468 correlate with, and may be deduced from, the identity of the host target genes which VGAM2468 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34520] Nucleotide sequences of the VGAM2468 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2468 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2468 are further described hereinbelow with reference to Table 1.

[34521] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2468 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34522] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2469 (VGAM2469) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34523] VGAM2469 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2469 was detected is described hereinabove with reference to Figs. 2-8.

[34524] VGAM2469 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2469 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34525] VGAM2469 gene, herein designated VGAM GENE, encodes a VGAM2469 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2469 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2469 precursor RNA is designated SEQ ID:2455, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2455 is located at position 226054 relative to the genome of Mouse cytomegalovirus 1.

[34526] VGAM2469 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34527] An enzyme complex designated DICER COMPLEX, dices the VGAM2469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2469 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2469 RNA is designated SEQ ID:5180, and is provided hereinbelow with reference to the sequence listing part.

[34528] VGAM2469 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2469 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2469 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34529] VGAM2469 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2469 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2469 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2469 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2469 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34530] The complementary binding of VGAM2469 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2469 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2469 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2469 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34531] It is appreciated that VGAM2469 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2469 host target genes. The mRNA of each one of this plurality of VGAM2469 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2469 RNA, herein designated VGAM RNA, and which when bound by VGAM2469 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2469 host target proteins.

[34532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2469 gene, herein designated VGAM GENE, on one or more VGAM2469 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34533] It is yet further appreciated that a function of VGAM2469 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2469 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2469 correlate with, and may be deduced from, the identity of the host target genes which VGAM2469 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34534] Nucleotide sequences of the VGAM2469 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2469 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2469 are further

described hereinbelow with reference to Table 1.

[34535] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2469 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34536] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2470 (VGAM2470) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34537] VGAM2470 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2470 was detected is described hereinabove with reference to Figs. 2-8.

[34538] VGAM2470 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2470 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34539] VGAM2470 gene, herein designated VGAM GENE, encodes a VGAM2470 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2470 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2470 precursor RNA is designated SEQ ID:2456, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2456 is located at position 195573 relative to the genome of Mouse cytomegalovirus 1.

[34540] VGAM2470 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34541] An enzyme complex designated DICER COMPLEX, dices

the VGAM2470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2470 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2470 RNA is designated SEQ ID:5181, and is provided hereinbelow with reference to the sequence listing part.

[34542] VGAM2470 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2470 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2470 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34543] VGAM2470 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2470 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2470 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2470 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2470 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34544] The complementary binding of VGAM2470 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2470 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2470 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2470 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34545] It is appreciated that VGAM2470 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2470 host target genes. The mRNA of each one of this plurality of VGAM2470 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2470 RNA, herein designated VGAM RNA, and which when bound by VGAM2470 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2470 host target proteins.

[34546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2470 gene, herein designated VGAM GENE, on one or more VGAM2470 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34547] It is yet further appreciated that a function of VGAM2470 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2470 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2470 correlate with, and may be deduced from, the identity of the host target genes which VGAM2470 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34548] Nucleotide sequences of the VGAM2470 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2470 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2470 are further described hereinbelow with reference to Table 1.

[34549] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2470 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34550] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2471 (VGAM2471) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34551] VGAM2471 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2471 was detected is described hereinabove with reference to Figs. 2-8.

[34552] VGAM2471 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2471 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[34553] VGAM2471 gene, herein designated VGAM GENE, encodes a VGAM2471 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2471 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2471 precursor RNA is designated SEQ ID:2457, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2457 is located at position 2006 relative to the genome of Mouse cytomegalovirus 1.

[34554] VGAM2471 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34555] An enzyme complex designated DICER COMPLEX, dices the VGAM2471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2471 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2471 RNA is designated SEQ ID:5182, and is provided hereinbelow with reference to the sequence listing part.

[34556] VGAM2471 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2471 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2471 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34557] VGAM2471 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2471 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2471 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2471 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2471 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34558] The complementary binding of VGAM2471 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2471 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2471 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2471 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34559] It is appreciated that VGAM2471 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2471 host target genes. The mRNA of each one of this plurality of VGAM2471 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2471 RNA, herein designated VGAM RNA, and which when bound by VGAM2471 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2471 host target proteins.

[34560] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2471 gene, herein designated VGAM GENE, on one or more VGAM2471 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34561] It is yet further appreciated that a function of VGAM2471 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2471 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2471 correlate with, and may be deduced from, the identity of the host target genes which VGAM2471 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34562] Nucleotide sequences of the VGAM2471 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2471 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2471 are further described hereinbelow with reference to Table 1.

[34563] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2471 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34564] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2472 (VGAM2472) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34565] VGAM2472 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2472 was detected is described hereinabove with reference to Figs. 2-8.

[34566] VGAM2472 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus

1. VGAM2472 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34567] VGAM2472 gene, herein designated VGAM GENE, encodes a VGAM2472 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2472 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2472 precursor RNA is designated SEQ ID:2458, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2458 is located at position 116628 relative to the genome of Mouse cytomegalovirus 1.

[34568] VGAM2472 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34569] An enzyme complex designated DICER COMPLEX, dices the VGAM2472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2472 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2472 RNA is designated SEQ ID:5183, and is provided hereinbelow with reference to the sequence listing part.

[34570] VGAM2472 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34571] VGAM2472 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2472 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2472 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34572] The complementary binding of VGAM2472 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2472 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34573] It is appreciated that VGAM2472 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2472 host target genes. The mRNA of each one of this plurality of VGAM2472 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2472 RNA, herein designated VGAM RNA, and which when bound by VGAM2472 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2472 host target proteins.

[34574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2472 gene, herein designated VGAM GENE, on one or more VGAM2472 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34575] It is yet further appreciated that a function of VGAM2472 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2472 correlate with, and may be deduced from, the identity of the host target genes which VGAM2472 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34576] Nucleotide sequences of the VGAM2472 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2472 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2472 are further described hereinbelow with reference to Table 1.

[34577] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2472 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34578] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2473 (VGAM2473) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34579] VGAM2473 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2473 was detected is described hereinabove with reference to Figs. 2-8.

[34580] VGAM2473 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2473 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34581] VGAM2473 gene, herein designated VGAM GENE, encodes a VGAM2473 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2473 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2473 precursor RNA is designated SEQ ID:2459, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2459 is located at position 101492 relative to the genome of Mouse cytomegalovirus 1.

[34582] VGAM2473 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34583] An enzyme complex designated DICER COMPLEX, dices the VGAM2473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2473 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2473 RNA is designated SEQ ID:5184, and is provided hereinbelow with reference to the sequence listing part.

[34584] VGAM2473 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34585] VGAM2473 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2473 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2473 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[34586] The complementary binding of VGAM2473 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2473 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34587] It is appreciated that VGAM2473 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2473 host target genes. The mRNA of each one of this plurality of VGAM2473 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2473 RNA, herein designated VGAM RNA, and which when bound by VGAM2473 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2473 host target proteins.

[34588] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2473 gene, herein designated VGAM GENE, on one or more VGAM2473 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34589] It is yet further appreciated that a function of VGAM2473 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2473 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2473 correlate with, and may be deduced from, the identity of the host target genes which VGAM2473 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[34590] Nucleotide sequences of the VGAM2473 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2473 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2473 are further described hereinbelow with reference to Table 1.

[34591] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2473 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34592] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2474 (VGAM2474) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34593] VGAM2474 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2474 was detected is described hereinabove with reference to Figs. 2-8.

[34594] VGAM2474 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2474 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34595] VGAM2474 gene, herein designated VGAM GENE, encodes a VGAM2474 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2474 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2474 precursor RNA is designated SEQ ID:2460, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2460 is located at position 82294 relative to the genome of Mouse cytomegalovirus 1.

[34596] VGAM2474 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34597] An enzyme complex designated DICER COMPLEX, dices the VGAM2474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2474 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2474 RNA is designated SEQ ID:5185, and is provided hereinbelow with reference to the sequence listing part.

[34598] VGAM2474 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34599] VGAM2474 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2474 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2474 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34600] The complementary binding of VGAM2474 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2474 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34601] It is appreciated that VGAM2474 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2474 host target genes. The mRNA of each one of this plurality of VGAM2474 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2474 RNA, herein designated VGAM RNA, and which when bound by VGAM2474 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2474 host target proteins.

[34602] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2474 gene, herein designated VGAM GENE, on one or more VGAM2474 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34603] It is yet further appreciated that a function of VGAM2474 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2474 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2474 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2474 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34604] Nucleotide sequences of the VGAM2474 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2474 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2474 are further described hereinbelow with reference to Table 1.

[34605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2474 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34606] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2475 (VGAM2475) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34607] VGAM2475 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2475 was detected is described hereinabove with reference to Figs. 2-8.

[34608] VGAM2475 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2475 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34609] VGAM2475 gene, herein designated VGAM GENE, encodes a VGAM2475 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2475 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2475 precursor RNA is designated SEQ ID:2461, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2461 is located at position 190173 relative to the genome of Mouse cytomegalovirus 1.

[34610] VGAM2475 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2475 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34611] An enzyme complex designated DICER COMPLEX, dices the VGAM2475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2475 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2475 RNA is designated SEQ ID:5186, and is provided hereinbelow with reference to the sequence listing part.

[34612] VGAM2475 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2475 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2475 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34613] VGAM2475 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2475 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2475 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2475 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34614] The complementary binding of VGAM2475 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2475 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2475 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2475 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34615] It is appreciated that VGAM2475 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2475 host target genes. The mRNA of each one of this plurality of VGAM2475 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2475 RNA, herein designated VGAM RNA, and which when bound by VGAM2475 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2475 host target proteins.

[34616] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2475 gene, herein designated VGAM GENE, on one or more VGAM2475 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34617] It is yet further appreciated that a function of VGAM2475 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2475 correlate with, and may be deduced from, the identity of the host target genes which VGAM2475 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34618] Nucleotide sequences of the VGAM2475 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2475 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2475 are further described hereinbelow with reference to Table 1.

[34619] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2475 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34620] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2476 (VGAM2476) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[34621] VGAM2476 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2476 was detected is described hereinabove with reference to Figs. 2-8.

[34622] VGAM2476 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2476 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34623] VGAM2476 gene, herein designated VGAM GENE, encodes a VGAM2476 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2476 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2476 precursor RNA is designated SEQ ID:2462, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2462 is located at position 136488 relative to the genome of Mouse cytomegalovirus 1.

[34624] VGAM2476 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34625] An enzyme complex designated DICER COMPLEX, dices the VGAM2476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2476 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2476 RNA is designated SEQ ID:5187, and is provided hereinbelow with reference to the sequence listing part.

[34626] VGAM2476 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34627] VGAM2476 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2476 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2476 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34628] The complementary binding of VGAM2476 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2476 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34629] It is appreciated that VGAM2476 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2476 host target genes. The mRNA of each one of this plurality of VGAM2476 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2476 RNA, herein designated VGAM

RNA, and which when bound by VGAM2476 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2476 host target proteins.

[34630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2476 gene, herein designated VGAM GENE, on one or more VGAM2476 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34631] It is yet further appreciated that a function of VGAM2476 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2476 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2476 correlate with, and may be deduced from, the identity of the host target genes which VGAM2476 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34632] Nucleotide sequences of the VGAM2476 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2476 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2476 are further described hereinbelow with reference to Table 1.

[34633] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2476 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34634] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2477 (VGAM2477) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34635] VGAM2477 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2477 was detected is described hereinabove with reference to Figs. 2-8.

[34636] VGAM2477 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2477 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34637] VGAM2477 gene, herein designated VGAM GENE, encodes a VGAM2477 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2477 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2477 precursor RNA is designated SEQ ID:2463, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2463 is located at position

205607 relative to the genome of Mouse cytomegalovirus 1.

[34638] VGAM2477 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34639] An enzyme complex designated DICER COMPLEX, dices the VGAM2477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2477 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2477 RNA is designated SEQ ID:5188, and is provided hereinbelow with reference to the sequence

listing part.

[34640] VGAM2477 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34641] VGAM2477 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2477 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34642] The complementary binding of VGAM2477 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2477 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34643] It is appreciated that VGAM2477 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2477 host target genes. The mRNA of each one of this plurality of VGAM2477 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2477 RNA, herein designated VGAM RNA, and which when bound by VGAM2477 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2477 host target proteins.

[34644] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2477 gene, herein designated VGAM GENE, on one or more VGAM2477 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34645] It is yet further appreciated that a function of VGAM2477

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2477 correlate with, and may be deduced from, the identity of the host target genes which VGAM2477 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34646] Nucleotide sequences of the VGAM2477 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2477 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2477 are further described hereinbelow with reference to Table 1.

[34647] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2477 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34648] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2478 (VGAM2478) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34649] VGAM2478 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2478 was detected is described hereinabove with reference to Figs. 2-8.

[34650] VGAM2478 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2478 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34651] VGAM2478 gene, herein designated VGAM GENE, encodes a VGAM2478 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2478 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2478 precursor RNA is designated SEQ ID:2464, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2464 is located at position 55947 relative to the genome of Mouse cytomegalovirus 1.

[34652] VGAM2478 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34653] An enzyme complex designated DICER COMPLEX, dices the VGAM2478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2478 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM2478 RNA is designated SEQ ID:5189, and is provided hereinbelow with reference to the sequence listing part.

[34654] VGAM2478 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34655] VGAM2478 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2478 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34656] The complementary binding of VGAM2478 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2478 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34657] It is appreciated that VGAM2478 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2478 host target genes. The mRNA of

each one of this plurality of VGAM2478 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2478 RNA, herein designated VGAM RNA, and which when bound by VGAM2478 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2478 host target proteins.

[34658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2478 gene, herein designated VGAM GENE, on one or more VGAM2478 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[34659] It is yet further appreciated that a function of VGAM2478 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2478 correlate with, and may be deduced from, the identity of the host target genes which VGAM2478 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34660] Nucleotide sequences of the VGAM2478 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2478 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2478 are further described hereinbelow with reference to Table 1.

[34661] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2478 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[34662] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2479 (VGAM2479) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34663] VGAM2479 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2479 was detected is described hereinabove with reference to Figs. 2-8.

[34664] VGAM2479 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2479 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34665] VGAM2479 gene, herein designated VGAM GENE, encodes a VGAM2479 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2479 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2479 precursor RNA is designated SEQ ID:2465, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2465 is located at position 167759 relative to the genome of Mouse cytomegalovirus 1.

[34666] VGAM2479 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34667] An enzyme complex designated DICER COMPLEX, dices

the VGAM2479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2479 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2479 RNA is designated SEQ ID:5190, and is provided hereinbelow with reference to the sequence listing part.

[34668] VGAM2479 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2479 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2479 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34669] VGAM2479 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2479 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2479 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2479 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2479 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34670] The complementary binding of VGAM2479 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2479 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2479 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2479 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34671] It is appreciated that VGAM2479 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2479 host target genes. The mRNA of each one of this plurality of VGAM2479 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2479 RNA, herein designated VGAM RNA, and which when bound by VGAM2479 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2479 host target proteins.

[34672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2479 gene, herein designated VGAM GENE, on one or more VGAM2479 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34673] It is yet further appreciated that a function of VGAM2479 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2479 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2479 correlate with, and may be deduced from, the identity of the host target genes which VGAM2479 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34674] Nucleotide sequences of the VGAM2479 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2479 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2479 are further described hereinbelow with reference to Table 1.

[34675] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2479 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34676] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2480 (VGAM2480) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34677] VGAM2480 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2480 was detected is described hereinabove with reference to Figs. 2-8.

[34678] VGAM2480 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2480 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[34679] VGAM2480 gene, herein designated VGAM GENE, encodes a VGAM2480 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2480 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2480 precursor RNA is designated SEQ ID:2466, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2466 is located at position 131305 relative to the genome of Mouse cytomegalovirus 1.

[34680] VGAM2480 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[34681] An enzyme complex designated DICER COMPLEX, dices the VGAM2480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2480 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2480 RNA is designated SEQ ID:5191, and is provided hereinbelow with reference to the sequence listing part.

[34682] VGAM2480 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2480 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2480 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34683] VGAM2480 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2480 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2480 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2480 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2480 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34684] The complementary binding of VGAM2480 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2480 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2480 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2480 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34685] It is appreciated that VGAM2480 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2480 host target genes. The mRNA of each one of this plurality of VGAM2480 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2480 RNA, herein designated VGAM RNA, and which when bound by VGAM2480 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2480 host target proteins.

[34686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2480 gene, herein designated VGAM GENE, on one or more VGAM2480 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34687] It is yet further appreciated that a function of VGAM2480 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2480 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2480 correlate with, and may be deduced from, the identity of the host target genes which VGAM2480 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34688] Nucleotide sequences of the VGAM2480 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2480 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2480 are further described hereinbelow with reference to Table 1.

[34689] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2480 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34690] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2481 (VGAM2481) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34691] VGAM2481 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2481 was detected is described hereinabove with reference to Figs. 2-8.

[34692] VGAM2481 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Mouse cytomegalovirus 1. VGAM2481 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34693] VGAM2481 gene, herein designated VGAM GENE, encodes a VGAM2481 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2481 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2481 precursor RNA is designated SEQ ID:2467, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2467 is located at position 96988 relative to the genome of Mouse cytomegalovirus 1.

[34694] VGAM2481 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34695] An enzyme complex designated DICER COMPLEX, dices the VGAM2481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2481 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM2481 RNA is designated SEQ ID:5192, and is provided hereinbelow with reference to the sequence listing part.

[34696] VGAM2481 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[34697] VGAM2481 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2481 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34698] The complementary binding of VGAM2481 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2481 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34699] It is appreciated that VGAM2481 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2481 host target genes. The mRNA of each one of this plurality of VGAM2481 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2481 RNA, herein designated VGAM RNA, and which when bound by VGAM2481 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2481 host target proteins.

[34700] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2481 gene, herein designated VGAM GENE, on one

or more VGAM2481 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34701] It is yet further appreciated that a function of VGAM2481 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2481 correlate with, and may be deduced from, the identity of the host target genes which VGAM2481 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34702] Nucleotide sequences of the VGAM2481 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2481 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2481 are further described hereinbelow with reference to Table 1.

[34703] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2481 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34704] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2482 (VGAM2482) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34705] VGAM2482 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2482 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[34706] VGAM2482 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2482 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34707] VGAM2482 gene, herein designated VGAM GENE, encodes a VGAM2482 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2482 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2482 precursor RNA is designated SEQ ID:2468, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2468 is located at position 182861 relative to the genome of Mouse cytomegalovirus 1.

[34708] VGAM2482 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34709] An enzyme complex designated DICER COMPLEX, dices the VGAM2482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2482 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2482 RNA is designated SEQ ID:5193, and is provided hereinbelow with reference to the sequence listing part.

[34710] VGAM2482 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34711] VGAM2482 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2482 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2482 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34712] The complementary binding of VGAM2482 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2482 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34713] It is appreciated that VGAM2482 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2482 host target genes. The mRNA of each one of this plurality of VGAM2482 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2482 RNA, herein designated VGAM RNA, and which when bound by VGAM2482 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2482 host target proteins.

[34714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2482 gene, herein designated VGAM GENE, on one or more VGAM2482 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34715] It is yet further appreciated that a function of VGAM2482 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2482 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2482 correlate with, and may be deduced from, the identity of the host target genes which VGAM2482 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[34716] Nucleotide sequences of the VGAM2482 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2482 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2482 are further described hereinbelow with reference to Table 1.

[34717] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2482 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34718] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2483 (VGAM2483) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34719] VGAM2483 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2483 was detected is described hereinabove with reference to Figs. 2-8.

[34720] VGAM2483 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2483 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34721] VGAM2483 gene, herein designated VGAM GENE, encodes a VGAM2483 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2483 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2483 precursor RNA is designated SEQ ID:2469, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2469 is located at position 166603 relative to the genome of Mouse cytomegalovirus 1.

[34722] VGAM2483 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2483 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34723] An enzyme complex designated DICER COMPLEX, dices the VGAM2483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2483 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2483 RNA is designated SEQ ID:5194, and is provided hereinbelow with reference to the sequence listing part.

[34724] VGAM2483 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2483 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2483 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34725] VGAM2483 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2483 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2483 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2483 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34726] The complementary binding of VGAM2483 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2483 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2483 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2483 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34727] It is appreciated that VGAM2483 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2483 host target genes. The mRNA of each one of this plurality of VGAM2483 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2483 RNA, herein designated VGAM RNA, and which when bound by VGAM2483 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2483 host target proteins.

[34728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2483 gene, herein designated VGAM GENE, on one or more VGAM2483 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34729] It is yet further appreciated that a function of VGAM2483 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2483

correlate with, and may be deduced from, the identity of the host target genes which VGAM2483 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34730] Nucleotide sequences of the VGAM2483 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2483 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2483 are further described hereinbelow with reference to Table 1.

[34731] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2483 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34732] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2484 (VGAM2484) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[34733] VGAM2484 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2484 was detected is described hereinabove with reference to Figs. 2-8.

[34734] VGAM2484 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2484 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34735] VGAM2484 gene, herein designated VGAM GENE, encodes a VGAM2484 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2484 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2484 precursor RNA is designated SEQ ID:2470, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2470 is located at position 183727 relative to the genome of Mouse cytomegalovirus 1.

[34736] VGAM2484 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34737] An enzyme complex designated DICER COMPLEX, dices the VGAM2484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2484 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2484 RNA is designated SEQ ID:5195, and is provided hereinbelow with reference to the sequence listing part.

[34738] VGAM2484 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2484 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2484 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34739] VGAM2484 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2484 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2484 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2484 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2484 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34740] The complementary binding of VGAM2484 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2484 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2484 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2484 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34741] It is appreciated that VGAM2484 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2484 host target genes. The mRNA of each one of this plurality of VGAM2484 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2484 RNA, herein designated VGAM RNA, and which when bound by VGAM2484 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2484 host target proteins.

[34742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2484 gene, herein designated VGAM GENE, on one or more VGAM2484 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34743] It is yet further appreciated that a function of VGAM2484 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2484 include diagnosis, prevention and

treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2484 correlate with, and may be deduced from, the identity of the host target genes which VGAM2484 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34744] Nucleotide sequences of the VGAM2484 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2484 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2484 are further described hereinbelow with reference to Table 1.

[34745] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2484 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34746] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2485 (VGAM2485) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34747] VGAM2485 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2485 was detected is described hereinabove with reference to Figs. 2-8.

[34748] VGAM2485 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2485 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34749] VGAM2485 gene, herein designated VGAM GENE, encodes a VGAM2485 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2485 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2485 precursor RNA is designated SEQ ID:2471, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2471 is located at position 214191 relative to the genome of Mouse cytomegalovirus

1.

[34750] VGAM2485 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34751] An enzyme complex designated DICER COMPLEX, dices the VGAM2485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2485 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2485 RNA is designated SEQ ID:5196, and is provided hereinbelow with reference to the sequence listing part.

[34752] VGAM2485 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34753] VGAM2485 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2485 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34754] The complementary binding of VGAM2485 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2485 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34755] It is appreciated that VGAM2485 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2485 host target genes. The mRNA of each one of this plurality of VGAM2485 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2485 RNA, herein designated VGAM RNA, and which when bound by VGAM2485 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2485 host target proteins.

[34756] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2485 gene, herein designated VGAM GENE, on one or more VGAM2485 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34757] It is yet further appreciated that a function of VGAM2485 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2485 correlate with, and may be deduced from, the identity of the host target genes which VGAM2485 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34758] Nucleotide sequences of the VGAM2485 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2485 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2485 are further described hereinbelow with reference to Table 1.

[34759] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2485 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34760] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2486 (VGAM2486) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34761] VGAM2486 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2486 was detected is described hereinabove with reference to Figs. 2-8.

[34762] VGAM2486 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2486 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34763] VGAM2486 gene, herein designated VGAM GENE, encodes a VGAM2486 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2486 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2486 precursor RNA is designated SEQ ID:2472, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2472 is located at position 54581 relative to the genome of Mouse cytomegalovirus 1.

[34764] VGAM2486 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34765] An enzyme complex designated DICER COMPLEX, dices the VGAM2486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2486 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2486 RNA is designated SEQ ID:5197, and

is provided hereinbelow with reference to the sequence listing part.

[34766] VGAM2486 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34767] VGAM2486 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2486 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34768] The complementary binding of VGAM2486 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2486 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34769] It is appreciated that VGAM2486 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2486 host target genes. The mRNA of each one of this plurality of VGAM2486 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2486 RNA, herein designated VGAM RNA, and which when bound by VGAM2486 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2486 host target proteins.

[34770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2486 gene, herein designated VGAM GENE, on one or more VGAM2486 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34771] It is yet further appreciated that a function of VGAM2486 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2486 correlate with, and may be deduced from, the identity of the host target genes which VGAM2486 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34772] Nucleotide sequences of the VGAM2486 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2486 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2486 are further described hereinbelow with reference to Table 1.

[34773] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2486 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34774] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2487 (VGAM2487) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34775] VGAM2487 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2487 was detected is described hereinabove with reference to Figs. 2-8.

[34776] VGAM2487 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2487 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34777] VGAM2487 gene, herein designated VGAM GENE, encodes a VGAM2487 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2487 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2487 precur-

sor RNA is designated SEQ ID:2473, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2473 is located at position 105519 relative to the genome of Mouse cytomegalovirus 1.

[34778] VGAM2487 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34779] An enzyme complex designated DICER COMPLEX, dices the VGAM2487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2487 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2487 RNA is designated SEQ ID:5198, and is provided hereinbelow with reference to the sequence listing part.

[34780] VGAM2487 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34781] VGAM2487 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2487 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2487 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34782] The complementary binding of VGAM2487 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2487 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34783] It is appreciated that VGAM2487 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2487 host target genes. The mRNA of each one of this plurality of VGAM2487 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2487 RNA, herein designated VGAM RNA, and which when bound by VGAM2487 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2487 host target proteins.

[34784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2487 gene, herein designated VGAM GENE, on one or more VGAM2487 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34785] It is yet further appreciated that a function of VGAM2487 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2487 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2487 correlate with, and may be deduced from, the identity of the host target genes which VGAM2487 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34786] Nucleotide sequences of the VGAM2487 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2487 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2487 are further described hereinbelow with reference to Table 1.

[34787] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2487 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34788] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2488 (VGAM2488) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34789] VGAM2488 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2488 was detected is described hereinabove with reference to Figs. 2-8.

[34790] VGAM2488 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2488 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34791] VGAM2488 gene, herein designated VGAM GENE, encodes a VGAM2488 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2488 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2488 precursor RNA is designated SEQ ID:2474, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2474 is located at position 77638 relative to the genome of Mouse cytomegalovirus 1.

[34792] VGAM2488 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34793] An enzyme complex designated DICER COMPLEX, dices the VGAM2488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2488 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2488 RNA is designated SEQ ID:5199, and is provided hereinbelow with reference to the sequence listing part.

[34794] VGAM2488 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34795] VGAM2488 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2488 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34796] The complementary binding of VGAM2488 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2488 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34797] It is appreciated that VGAM2488 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2488 host target genes. The mRNA of each one of this plurality of VGAM2488 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2488 RNA, herein designated VGAM RNA, and which when bound by VGAM2488 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2488 host target proteins.

[34798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2488 gene, herein designated VGAM GENE, on one or more VGAM2488 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34799] It is yet further appreciated that a function of VGAM2488 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2488 correlate with, and may be deduced from, the identity of the host target genes which VGAM2488 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34800] Nucleotide sequences of the VGAM2488 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2488 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2488 are further described hereinbelow with reference to Table 1.

[34801] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2488 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34802] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2489 (VGAM2489) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34803] VGAM2489 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2489 was detected is described hereinabove with reference to Figs. 2-8.

[34804] VGAM2489 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2489 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34805] VGAM2489 gene, herein designated VGAM GENE, encodes a VGAM2489 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2489 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2489 precursor RNA is designated SEQ ID:2475, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2475 is located at position 131589 relative to the genome of Mouse cytomegalovirus 1.

[34806] VGAM2489 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34807] An enzyme complex designated DICER COMPLEX, dices the VGAM2489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2489 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2489 RNA is designated SEQ ID:5200, and is provided hereinbelow with reference to the sequence listing part.

[34808] VGAM2489 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34809] VGAM2489 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2489 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2489 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34810] The complementary binding of VGAM2489 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2489 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34811] It is appreciated that VGAM2489 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2489 host target genes. The mRNA of each one of this plurality of VGAM2489 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2489 RNA, herein designated VGAM RNA, and which when bound by VGAM2489 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2489 host target proteins.

[34812] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2489 gene, herein designated VGAM GENE, on one or more VGAM2489 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34813] It is yet further appreciated that a function of VGAM2489 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2489 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2489 correlate with, and may be deduced from, the identity of the host target genes which VGAM2489 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34814] Nucleotide sequences of the VGAM2489 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2489 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2489 are further described hereinbelow with reference to Table 1.

[34815] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2489 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34816] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2490 (VGAM2490) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34817] VGAM2490 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2490 was detected is described hereinabove with reference to Figs. 2-8.

[34818] VGAM2490 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2490 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34819] VGAM2490 gene, herein designated VGAM GENE, encodes

a VGAM2490 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2490 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2490 precursor RNA is designated SEQ ID:2476, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2476 is located at position 47693 relative to the genome of Mouse cytomegalovirus 1.

[34820] VGAM2490 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34821] An enzyme complex designated DICER COMPLEX, dices the VGAM2490 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2490 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2490 RNA is designated SEQ ID:5201, and is provided hereinbelow with reference to the sequence listing part.

[34822] VGAM2490 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2490 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2490 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34823] VGAM2490 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2490 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2490 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2490 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2490 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34824] The complementary binding of VGAM2490 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2490 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2490

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2490 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34825] It is appreciated that VGAM2490 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2490 host target genes. The mRNA of each one of this plurality of VGAM2490 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2490 RNA, herein designated VGAM RNA, and which when bound by VGAM2490 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2490 host target proteins.

[34826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2490 gene, herein designated VGAM GENE, on one or more VGAM2490 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34827] It is yet further appreciated that a function of VGAM2490 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2490 correlate with, and may be deduced from, the identity of the host target genes which VGAM2490 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34828] Nucleotide sequences of the VGAM2490 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2490 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2490 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2490 are further described hereinbelow with reference to Table 1.

[34829] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2490 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34830] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2491 (VGAM2491) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34831] VGAM2491 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2491 was detected is described hereinabove with reference to Figs. 2-8.

[34832] VGAM2491 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2491 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[34833] VGAM2491 gene, herein designated VGAM GENE, encodes a VGAM2491 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2491 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2491 precursor RNA is designated SEQ ID:2477, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2477 is located at position 198448 relative to the genome of Mouse cytomegalovirus 1.

[34834] VGAM2491 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34835] An enzyme complex designated DICER COMPLEX, dices the VGAM2491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2491 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2491 RNA is designated SEQ ID:5202, and is provided hereinbelow with reference to the sequence listing part.

[34836] VGAM2491 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2491 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2491 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34837] VGAM2491 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2491 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2491 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2491 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34838] The complementary binding of VGAM2491 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2491 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2491 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2491 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34839] It is appreciated that VGAM2491 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2491 host target genes. The mRNA of each one of this plurality of VGAM2491 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2491 RNA, herein designated VGAM RNA, and which when bound by VGAM2491 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2491 host target proteins.

[34840] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2491 gene, herein designated VGAM GENE, on one or more VGAM2491 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34841] It is yet further appreciated that a function of VGAM2491 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2491 correlate with, and may be deduced from, the identity of the host target genes which VGAM2491 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34842] Nucleotide sequences of the VGAM2491 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2491 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2491 are further described hereinbelow with reference to Table 1.

[34843] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2491 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34844] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2492 (VGAM2492) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34845] VGAM2492 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2492 was detected is described hereinabove with reference to Figs. 2-8.

[34846] VGAM2492 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus

1. VGAM2492 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34847] VGAM2492 gene, herein designated VGAM GENE, encodes a VGAM2492 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2492 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2492 precursor RNA is designated SEQ ID:2478, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2478 is located at position 124024 relative to the genome of Mouse cytomegalovirus 1.

[34848] VGAM2492 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34849] An enzyme complex designated DICER COMPLEX, dices the VGAM2492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2492 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2492 RNA is designated SEQ ID:5203, and is provided hereinbelow with reference to the sequence listing part.

[34850] VGAM2492 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2492 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2492 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34851] VGAM2492 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2492 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2492 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2492 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2492 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34852] The complementary binding of VGAM2492 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2492 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2492 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2492 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34853] It is appreciated that VGAM2492 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2492 host target genes. The mRNA of each one of this plurality of VGAM2492 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2492 RNA, herein designated VGAM RNA, and which when bound by VGAM2492 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2492 host target proteins.

[34854] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2492 gene, herein designated VGAM GENE, on one or more VGAM2492 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34855] It is yet further appreciated that a function of VGAM2492 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2492 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2492 correlate with, and may be deduced from, the identity of the host target genes which VGAM2492 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34856] Nucleotide sequences of the VGAM2492 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2492 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2492 are further described hereinbelow with reference to Table 1.

[34857] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2492 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34858] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2493 (VGAM2493) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34859] VGAM2493 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2493 was detected is described hereinabove with reference to Figs. 2-8.

[34860] VGAM2493 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2493 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34861] VGAM2493 gene, herein designated VGAM GENE, encodes a VGAM2493 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2493 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2493 precursor RNA is designated SEQ ID:2479, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2479 is located at position 160440 relative to the genome of Mouse cytomegalovirus 1.

[34862] VGAM2493 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34863] An enzyme complex designated DICER COMPLEX, dices the VGAM2493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2493 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2493 RNA is designated SEQ ID:5204, and is provided hereinbelow with reference to the sequence listing part.

[34864] VGAM2493 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2493 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2493 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34865] VGAM2493 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2493 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2493 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2493 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[34866] The complementary binding of VGAM2493 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2493 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2493 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2493 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34867] It is appreciated that VGAM2493 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2493 host target genes. The mRNA of each one of this plurality of VGAM2493 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2493 RNA, herein designated VGAM RNA, and which when bound by VGAM2493 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2493 host target proteins.

[34868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2493 gene, herein designated VGAM GENE, on one or more VGAM2493 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34869] It is yet further appreciated that a function of VGAM2493 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2493 correlate with, and may be deduced from, the identity of the host target genes which VGAM2493 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[34870] Nucleotide sequences of the VGAM2493 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2493 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2493 are further described hereinbelow with reference to Table 1.

[34871] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2493 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34872] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2494 (VGAM2494) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34873] VGAM2494 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2494 was detected is described hereinabove with reference to Figs. 2-8.

[34874] VGAM2494 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2494 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34875] VGAM2494 gene, herein designated VGAM GENE, encodes a VGAM2494 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2494 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2494 precursor RNA is designated SEQ ID:2480, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2480 is located at position 208377 relative to the genome of Mouse cytomegalovirus 1.

[34876] VGAM2494 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34877] An enzyme complex designated DICER COMPLEX, dices the VGAM2494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2494 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2494 RNA is designated SEQ ID:5205, and is provided hereinbelow with reference to the sequence listing part.

[34878] VGAM2494 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34879] VGAM2494 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2494 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34880] The complementary binding of VGAM2494 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2494 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34881] It is appreciated that VGAM2494 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2494 host target genes. The mRNA of each one of this plurality of VGAM2494 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2494 RNA, herein designated VGAM RNA, and which when bound by VGAM2494 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2494 host target proteins.

[34882] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2494 gene, herein designated VGAM GENE, on one or more VGAM2494 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34883] It is yet further appreciated that a function of VGAM2494 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2494 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2494 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34884] Nucleotide sequences of the VGAM2494 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2494 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2494 are further described hereinbelow with reference to Table 1.

[34885] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2494 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34886] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2495 (VGAM2495) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34887] VGAM2495 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2495 was detected is described hereinabove with reference to Figs. 2-8.

[34888] VGAM2495 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2495 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34889] VGAM2495 gene, herein designated VGAM GENE, encodes a VGAM2495 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2495 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2495 precursor RNA is designated SEQ ID:2481, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2481 is located at position 106389 relative to the genome of Mouse cytomegalovirus 1.

[34890] VGAM2495 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2495 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34891] An enzyme complex designated DICER COMPLEX, dices the VGAM2495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2495 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2495 RNA is designated SEQ ID:5206, and is provided hereinbelow with reference to the sequence listing part.

[34892] VGAM2495 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2495 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2495 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34893] VGAM2495 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2495 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2495 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2495 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2495 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34894] The complementary binding of VGAM2495 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2495 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2495 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2495 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34895] It is appreciated that VGAM2495 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2495 host target genes. The mRNA of each one of this plurality of VGAM2495 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2495 RNA, herein designated VGAM RNA, and which when bound by VGAM2495 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2495 host target proteins.

[34896] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2495 gene, herein designated VGAM GENE, on one or more VGAM2495 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34897] It is yet further appreciated that a function of VGAM2495 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2495 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2495 correlate with, and may be deduced from, the identity of the host target genes which VGAM2495 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34898] Nucleotide sequences of the VGAM2495 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2495 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2495 are further described hereinbelow with reference to Table 1.

[34899] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2495 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34900] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2496 (VGAM2496) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[34901] VGAM2496 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2496 was detected is described hereinabove with reference to Figs. 2-8.

[34902] VGAM2496 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2496 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34903] VGAM2496 gene, herein designated VGAM GENE, encodes a VGAM2496 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2496 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2496 precursor RNA is designated SEQ ID:2482, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2482 is located at position 186483 relative to the genome of Mouse cytomegalovirus 1.

[34904] VGAM2496 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34905] An enzyme complex designated DICER COMPLEX, dices the VGAM2496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2496 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2496 RNA is designated SEQ ID:5207, and is provided hereinbelow with reference to the sequence listing part.

[34906] VGAM2496 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34907] VGAM2496 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2496 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2496 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34908] The complementary binding of VGAM2496 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2496 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34909] It is appreciated that VGAM2496 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2496 host target genes. The mRNA of each one of this plurality of VGAM2496 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2496 RNA, herein designated VGAM

RNA, and which when bound by VGAM2496 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2496 host target proteins.

[34910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2496 gene, herein designated VGAM GENE, on one or more VGAM2496 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34911] It is yet further appreciated that a function of VGAM2496 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2496 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2496 correlate with, and may be deduced from, the identity of the host target genes which VGAM2496 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34912] Nucleotide sequences of the VGAM2496 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2496 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2496 are further described hereinbelow with reference to Table 1.

[34913] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2496 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34914] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2497 (VGAM2497) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34915] VGAM2497 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2497 was detected is described hereinabove with reference to Figs. 2-8.

[34916] VGAM2497 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2497 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34917] VGAM2497 gene, herein designated VGAM GENE, encodes a VGAM2497 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2497 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2497 precursor RNA is designated SEQ ID:2483, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2483 is located at position

212016 relative to the genome of Mouse cytomegalovirus 1.

[34918] VGAM2497 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34919] An enzyme complex designated DICER COMPLEX, dices the VGAM2497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2497 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2497 RNA is designated SEQ ID:5208, and is provided hereinbelow with reference to the sequence

listing part.

[34920] VGAM2497 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34921] VGAM2497 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2497 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34922] The complementary binding of VGAM2497 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2497 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34923] It is appreciated that VGAM2497 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2497 host target genes. The mRNA of each one of this plurality of VGAM2497 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2497 RNA, herein designated VGAM RNA, and which when bound by VGAM2497 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2497 host target proteins.

[34924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2497 gene, herein designated VGAM GENE, on one or more VGAM2497 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34925] It is yet further appreciated that a function of VGAM2497

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2497 correlate with, and may be deduced from, the identity of the host target genes which VGAM2497 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34926] Nucleotide sequences of the VGAM2497 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2497 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2497 are further described hereinbelow with reference to Table 1.

[34927] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2497 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34928] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2498 (VGAM2498) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34929] VGAM2498 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2498 was detected is described hereinabove with reference to Figs. 2-8.

[34930] VGAM2498 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2498 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34931] VGAM2498 gene, herein designated VGAM GENE, encodes a VGAM2498 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2498 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2498 precursor RNA is designated SEQ ID:2484, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2484 is located at position 211848 relative to the genome of Mouse cytomegalovirus 1.

[34932] VGAM2498 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34933] An enzyme complex designated DICER COMPLEX, dices the VGAM2498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2498 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide se-

quence of VGAM2498 RNA is designated SEQ ID:5209, and is provided hereinbelow with reference to the sequence listing part.

[34934] VGAM2498 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34935] VGAM2498 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2498 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2498 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34936] The complementary binding of VGAM2498 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2498 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34937] It is appreciated that VGAM2498 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2498 host target genes. The mRNA of

each one of this plurality of VGAM2498 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2498 RNA, herein designated VGAM RNA, and which when bound by VGAM2498 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2498 host target proteins.

[34938] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2498 gene, herein designated VGAM GENE, on one or more VGAM2498 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[34939] It is yet further appreciated that a function of VGAM2498 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2498 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2498 correlate with, and may be deduced from, the identity of the host target genes which VGAM2498 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34940] Nucleotide sequences of the VGAM2498 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2498 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2498 are further described hereinbelow with reference to Table 1.

[34941] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2498 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[34942] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2499 (VGAM2499) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34943] VGAM2499 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2499 was detected is described hereinabove with reference to Figs. 2-8.

[34944] VGAM2499 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2499 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34945] VGAM2499 gene, herein designated VGAM GENE, encodes a VGAM2499 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2499 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2499 precursor RNA is designated SEQ ID:2485, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2485 is located at position 88282 relative to the genome of Mouse cytomegalovirus 1.

[34946] VGAM2499 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34947] An enzyme complex designated DICER COMPLEX, dices the VGAM2499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2499 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2499 RNA is designated SEQ ID:5210, and is provided hereinbelow with reference to the sequence listing part.

[34948] VGAM2499 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34949] VGAM2499 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2499 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2499 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34950] The complementary binding of VGAM2499 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2499 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34951] It is appreciated that VGAM2499 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2499 host target genes. The mRNA of each one of this plurality of VGAM2499 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2499 RNA, herein designated VGAM RNA, and which when bound by VGAM2499 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2499 host target proteins.

[34952] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2499 gene, herein designated VGAM GENE, on one or more VGAM2499 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34953] It is yet further appreciated that a function of VGAM2499 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2499 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2499 correlate with, and may be deduced from, the identity of the host target genes which VGAM2499 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34954] Nucleotide sequences of the VGAM2499 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2499 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2499 are further described hereinbelow with reference to Table 1.

[34955] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2499 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34956] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2500 (VGAM2500) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34957] VGAM2500 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2500 was detected is described hereinabove with reference to Figs. 2-8.

[34958] VGAM2500 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2500 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34959] VGAM2500 gene, herein designated VGAM GENE, encodes a VGAM2500 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2500 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2500 precursor RNA is designated SEQ ID:2486, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2486 is located at position 173739 relative to the genome of Mouse cytomegalovirus 1.

[34960] VGAM2500 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34961] An enzyme complex designated DICER COMPLEX, dices the VGAM2500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2500 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2500 RNA is designated SEQ ID:5211, and is provided hereinbelow with reference to the sequence listing part.

[34962] VGAM2500 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34963] VGAM2500 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2500 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2500 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34964] The complementary binding of VGAM2500 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2500 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[34965] It is appreciated that VGAM2500 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2500 host target genes. The mRNA of each one of this plurality of VGAM2500 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2500 RNA, herein designated VGAM RNA, and which when bound by VGAM2500 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2500 host target proteins.

[34966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2500 gene, herein designated VGAM GENE, on one or more VGAM2500 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34967] It is yet further appreciated that a function of VGAM2500 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2500 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2500 correlate with, and may be deduced from, the identity of the host target genes which VGAM2500 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34968] Nucleotide sequences of the VGAM2500 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2500 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2500 are further described hereinbelow with reference to Table 1.

[34969] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2500 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34970] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2501 (VGAM2501) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34971] VGAM2501 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2501 was detected is described hereinabove with reference to Figs. 2-8.

[34972] VGAM2501 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2501 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34973] VGAM2501 gene, herein designated VGAM GENE, encodes a VGAM2501 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2501 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2501 precursor RNA is designated SEQ ID:2487, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2487 is located at position 72060 relative to the genome of Mouse cytomegalovirus 1.

[34974] VGAM2501 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34975] An enzyme complex designated DICER COMPLEX, dices the VGAM2501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2501 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2501 RNA is designated SEQ ID:5212, and is provided hereinbelow with reference to the sequence listing part.

[34976] VGAM2501 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2501 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2501 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34977] VGAM2501 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2501 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2501 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2501 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34978] The complementary binding of VGAM2501 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2501 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2501 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2501 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34979] It is appreciated that VGAM2501 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2501 host target genes. The mRNA of each one of this plurality of VGAM2501 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2501 RNA, herein designated VGAM RNA, and which when bound by VGAM2501 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2501 host target proteins.

[34980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2501 gene, herein designated VGAM GENE, on one or more VGAM2501 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34981] It is yet further appreciated that a function of VGAM2501 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2501 correlate with, and may be deduced from, the identity of the host target genes which VGAM2501 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34982] Nucleotide sequences of the VGAM2501 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2501 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2501 are further

described hereinbelow with reference to Table 1.

[34983] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2501 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34984] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2502 (VGAM2502) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34985] VGAM2502 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2502 was detected is described hereinabove with reference to Figs. 2-8.

[34986] VGAM2502 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2502 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34987] VGAM2502 gene, herein designated VGAM GENE, encodes a VGAM2502 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2502 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2502 precursor RNA is designated SEQ ID:2488, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2488 is located at position 192021 relative to the genome of Mouse cytomegalovirus 1.

[34988] VGAM2502 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34989] An enzyme complex designated DICER COMPLEX, dices

the VGAM2502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2502 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2502 RNA is designated SEQ ID:5213, and is provided hereinbelow with reference to the sequence listing part.

[34990] VGAM2502 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2502 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2502 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34991] VGAM2502 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2502 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2502 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2502 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2502 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34992] The complementary binding of VGAM2502 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2502 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2502 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2502 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34993] It is appreciated that VGAM2502 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2502 host target genes. The mRNA of each one of this plurality of VGAM2502 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2502 RNA, herein designated VGAM RNA, and which when bound by VGAM2502 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2502 host target proteins.

[34994] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2502 gene, herein designated VGAM GENE, on one or more VGAM2502 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34995] It is yet further appreciated that a function of VGAM2502 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2502 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2502 correlate with, and may be deduced from, the identity of the host target genes which VGAM2502 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34996] Nucleotide sequences of the VGAM2502 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2502 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2502 are further described hereinbelow with reference to Table 1.

[34997] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2502 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34998] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2503 (VGAM2503) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34999] VGAM2503 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2503 was detected is described hereinabove with reference to Figs. 2-8.

[35000] VGAM2503 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2503 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[35001] VGAM2503 gene, herein designated VGAM GENE, encodes a VGAM2503 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2503 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2503 precursor RNA is designated SEQ ID:2489, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2489 is located at position 125983 relative to the genome of Mouse cytomegalovirus 1.

[35002] VGAM2503 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[35003] An enzyme complex designated DICER COMPLEX, dices the VGAM2503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2503 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2503 RNA is designated SEQ ID:5214, and is provided hereinbelow with reference to the sequence listing part.

[35004] VGAM2503 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2503 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2503 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35005] VGAM2503 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2503 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2503 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2503 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35006] The complementary binding of VGAM2503 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2503 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2503 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2503 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35007] It is appreciated that VGAM2503 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2503 host target genes. The mRNA of each one of this plurality of VGAM2503 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2503 RNA, herein designated VGAM RNA, and which when bound by VGAM2503 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2503 host target proteins.

[35008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2503 gene, herein designated VGAM GENE, on one or more VGAM2503 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35009] It is yet further appreciated that a function of VGAM2503 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2503 correlate with, and may be deduced from, the identity of the host target genes which VGAM2503 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35010] Nucleotide sequences of the VGAM2503 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2503 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2503 are further described hereinbelow with reference to Table 1.

[35011] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2503 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35012] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2504 (VGAM2504) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35013] VGAM2504 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2504 was detected is described hereinabove with reference to Figs. 2-8.

[35014] VGAM2504 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Mouse cytomegalovirus 1. VGAM2504 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35015] VGAM2504 gene, herein designated VGAM GENE, encodes a VGAM2504 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2504 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2504 precursor RNA is designated SEQ ID:2490, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2490 is located at position 179418 relative to the genome of Mouse cytomegalovirus 1.

[35016] VGAM2504 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35017] An enzyme complex designated DICER COMPLEX, dices the VGAM2504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2504 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2504 RNA is designated SEQ ID:5215, and is provided hereinbelow with reference to the sequence listing part.

[35018] VGAM2504 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[35019] VGAM2504 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2504 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35020] The complementary binding of VGAM2504 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2504 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35021] It is appreciated that VGAM2504 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2504 host target genes. The mRNA of each one of this plurality of VGAM2504 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2504 RNA, herein designated VGAM RNA, and which when bound by VGAM2504 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2504 host target proteins.

[35022] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2504 gene, herein designated VGAM GENE, on one

or more VGAM2504 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35023] It is yet further appreciated that a function of VGAM2504 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2504 correlate with, and may be deduced from, the identity of the host target genes which VGAM2504 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35024] Nucleotide sequences of the VGAM2504 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2504 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2504 are further described hereinbelow with reference to Table 1.

[35025] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2504 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35026] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2505 (VGAM2505) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35027] VGAM2505 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2505 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[35028] VGAM2505 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2505 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35029] VGAM2505 gene, herein designated VGAM GENE, encodes a VGAM2505 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2505 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2505 precursor RNA is designated SEQ ID:2491, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2491 is located at position 75695 relative to the genome of Mouse cytomegalovirus 1.

[35030] VGAM2505 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35031] An enzyme complex designated DICER COMPLEX, dices the VGAM2505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2505 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2505 RNA is designated SEQ ID:5216, and is provided hereinbelow with reference to the sequence listing part.

[35032] VGAM2505 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35033] VGAM2505 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2505 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35034] The complementary binding of VGAM2505 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2505 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35035] It is appreciated that VGAM2505 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2505 host target genes. The mRNA of each one of this plurality of VGAM2505 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2505 RNA, herein designated VGAM RNA, and which when bound by VGAM2505 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2505 host target proteins.

[35036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2505 gene, herein designated VGAM GENE, on one or more VGAM2505 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35037] It is yet further appreciated that a function of VGAM2505 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2505 correlate with, and may be deduced from, the identity of the host target genes which VGAM2505 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[35038] Nucleotide sequences of the VGAM2505 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2505 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2505 are further described hereinbelow with reference to Table 1.

[35039] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2505 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35040] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2506 (VGAM2506) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35041] VGAM2506 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2506 was detected is described hereinabove with reference to Figs. 2-8.

[35042] VGAM2506 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2506 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35043] VGAM2506 gene, herein designated VGAM GENE, encodes a VGAM2506 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2506 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2506 precursor RNA is designated SEQ ID:2492, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2492 is located at position 165224 relative to the genome of Mouse cytomegalovirus 1.

[35044] VGAM2506 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2506 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35045] An enzyme complex designated DICER COMPLEX, dices the VGAM2506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2506 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2506 RNA is designated SEQ ID:5217, and is provided hereinbelow with reference to the sequence listing part.

[35046] VGAM2506 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2506 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2506 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35047] VGAM2506 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2506 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2506 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2506 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2506 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35048] The complementary binding of VGAM2506 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2506 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2506 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2506 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35049] It is appreciated that VGAM2506 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2506 host target genes. The mRNA of each one of this plurality of VGAM2506 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2506 RNA, herein designated VGAM RNA, and which when bound by VGAM2506 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2506 host target proteins.

[35050] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2506 gene, herein designated VGAM GENE, on one or more VGAM2506 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35051] It is yet further appreciated that a function of VGAM2506 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2506 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2506

correlate with, and may be deduced from, the identity of the host target genes which VGAM2506 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35052] Nucleotide sequences of the VGAM2506 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2506 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2506 are further described hereinbelow with reference to Table 1.

[35053] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2506 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35054] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2507 (VGAM2507) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[35055] VGAM2507 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2507 was detected is described hereinabove with reference to Figs. 2-8.

[35056] VGAM2507 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2507 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35057] VGAM2507 gene, herein designated VGAM GENE, encodes a VGAM2507 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2507 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2507 precursor RNA is designated SEQ ID:2493, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2493 is located at position 38544 relative to the genome of Mouse cytomegalovirus 1.

[35058] VGAM2507 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35059] An enzyme complex designated DICER COMPLEX, dices the VGAM2507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2507 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2507 RNA is designated SEQ ID:5218, and is provided hereinbelow with reference to the sequence listing part.

[35060] VGAM2507 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2507 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2507 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35061] VGAM2507 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2507 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2507 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2507 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2507 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35062] The complementary binding of VGAM2507 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2507 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2507 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2507 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35063] It is appreciated that VGAM2507 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2507 host target genes. The mRNA of each one of this plurality of VGAM2507 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2507 RNA, herein designated VGAM RNA, and which when bound by VGAM2507 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2507 host target proteins.

[35064] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2507 gene, herein designated VGAM GENE, on one or more VGAM2507 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35065] It is yet further appreciated that a function of VGAM2507 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2507 include diagnosis, prevention and

treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2507 correlate with, and may be deduced from, the identity of the host target genes which VGAM2507 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35066] Nucleotide sequences of the VGAM2507 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2507 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2507 are further described hereinbelow with reference to Table 1.

[35067] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2507 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35068] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2508 (VGAM2508) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35069] VGAM2508 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2508 was detected is described hereinabove with reference to Figs. 2-8.

[35070] VGAM2508 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2508 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35071] VGAM2508 gene, herein designated VGAM GENE, encodes a VGAM2508 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2508 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2508 precursor RNA is designated SEQ ID:2494, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2494 is located at position 168766 relative to the genome of Mouse cytomegalovirus

1.

[35072] VGAM2508 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35073] An enzyme complex designated DICER COMPLEX, dices the VGAM2508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2508 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2508 RNA is designated SEQ ID:5219, and is provided hereinbelow with reference to the sequence listing part.

[35074] VGAM2508 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35075] VGAM2508 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2508 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2508 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35076] The complementary binding of VGAM2508 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2508 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2508 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35077] It is appreciated that VGAM2508 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2508 host target genes. The mRNA of each one of this plurality of VGAM2508 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2508 RNA, herein designated VGAM RNA, and which when bound by VGAM2508 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2508 host target proteins.

[35078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2508 gene, herein designated VGAM GENE, on one or more VGAM2508 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35079] It is yet further appreciated that a function of VGAM2508 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2508 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2508 correlate with, and may be deduced from, the identity of the host target genes which VGAM2508 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35080] Nucleotide sequences of the VGAM2508 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2508 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2508 are further described hereinbelow with reference to Table 1.

[35081] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2508 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35082] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2509 (VGAM2509) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35083] VGAM2509 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2509 was detected is described hereinabove with reference to Figs. 2-8.

[35084] VGAM2509 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2509 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35085] VGAM2509 gene, herein designated VGAM GENE, encodes a VGAM2509 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2509 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2509 precursor RNA is designated SEQ ID:2495, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2495 is located at position 220001 relative to the genome of Mouse cytomegalovirus 1.

[35086] VGAM2509 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35087] An enzyme complex designated DICER COMPLEX, dices the VGAM2509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2509 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2509 RNA is designated SEQ ID:5220, and

is provided hereinbelow with reference to the sequence listing part.

[35088] VGAM2509 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35089] VGAM2509 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2509 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2509 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35090] The complementary binding of VGAM2509 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2509 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2509 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35091] It is appreciated that VGAM2509 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2509 host target genes. The mRNA of each one of this plurality of VGAM2509 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2509 RNA, herein designated VGAM RNA, and which when bound by VGAM2509 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2509 host target proteins.

[35092] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2509 gene, herein designated VGAM GENE, on one or more VGAM2509 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35093] It is yet further appreciated that a function of VGAM2509 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2509 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2509 correlate with, and may be deduced from, the identity of the host target genes which VGAM2509 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35094] Nucleotide sequences of the VGAM2509 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2509 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2509 are further described hereinbelow with reference to Table 1.

[35095] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2509 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35096] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2510 (VGAM2510) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35097] VGAM2510 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2510 was detected is described hereinabove with reference to Figs. 2-8.

[35098] VGAM2510 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2510 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35099] VGAM2510 gene, herein designated VGAM GENE, encodes a VGAM2510 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2510 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2510 precur-

sor RNA is designated SEQ ID:2496, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2496 is located at position 226893 relative to the genome of Mouse cytomegalovirus 1.

[35100] VGAM2510 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35101] An enzyme complex designated DICER COMPLEX, dices the VGAM2510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2510 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2510 RNA is designated SEQ ID:5221, and is provided hereinbelow with reference to the sequence listing part.

[35102] VGAM2510 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35103] VGAM2510 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2510 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2510 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35104] The complementary binding of VGAM2510 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2510 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2510 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35105] It is appreciated that VGAM2510 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2510 host target genes. The mRNA of each one of this plurality of VGAM2510 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2510 RNA, herein designated VGAM RNA, and which when bound by VGAM2510 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2510 host target proteins.

[35106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2510 gene, herein designated VGAM GENE, on one or more VGAM2510 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35107] It is yet further appreciated that a function of VGAM2510 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2510 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2510 correlate with, and may be deduced from, the identity of the host target genes which VGAM2510 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35108] Nucleotide sequences of the VGAM2510 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2510 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2510 are further described hereinbelow with reference to Table 1.

[35109] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2510 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35110] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2511 (VGAM2511) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35111] VGAM2511 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2511 was detected is described hereinabove with reference to Figs. 2-8.

[35112] VGAM2511 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2511 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35113] VGAM2511 gene, herein designated VGAM GENE, encodes a VGAM2511 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2511 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2511 precursor RNA is designated SEQ ID:2497, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2497 is located at position 36653 relative to the genome of Mouse cytomegalovirus 1.

[35114] VGAM2511 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35115] An enzyme complex designated DICER COMPLEX, dices the VGAM2511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2511 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2511 RNA is designated SEQ ID:5222, and is provided hereinbelow with reference to the sequence listing part.

[35116] VGAM2511 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35117] VGAM2511 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2511 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2511 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35118] The complementary binding of VGAM2511 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2511 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2511 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35119] It is appreciated that VGAM2511 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2511 host target genes. The mRNA of each one of this plurality of VGAM2511 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2511 RNA, herein designated VGAM RNA, and which when bound by VGAM2511 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2511 host target proteins.

[35120] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2511 gene, herein designated VGAM GENE, on one or more VGAM2511 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35121] It is yet further appreciated that a function of VGAM2511 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2511 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2511 correlate with, and may be deduced from, the identity of the host target genes which VGAM2511 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35122] Nucleotide sequences of the VGAM2511 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2511 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2511 are further described hereinbelow with reference to Table 1.

[35123] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2511 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35124] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2512 (VGAM2512) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35125] VGAM2512 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2512 was detected is described hereinabove with reference to Figs. 2-8.

[35126] VGAM2512 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2512 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35127] VGAM2512 gene, herein designated VGAM GENE, encodes a VGAM2512 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2512 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2512 precursor RNA is designated SEQ ID:2498, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2498 is located at position 84643 relative to the genome of Mouse cytomegalovirus 1.

[35128] VGAM2512 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35129] An enzyme complex designated DICER COMPLEX, dices the VGAM2512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2512 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2512 RNA is designated SEQ ID:5223, and is provided hereinbelow with reference to the sequence listing part.

[35130] VGAM2512 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35131] VGAM2512 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2512 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2512 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35132] The complementary binding of VGAM2512 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2512 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2512 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35133] It is appreciated that VGAM2512 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2512 host target genes. The mRNA of each one of this plurality of VGAM2512 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2512 RNA, herein designated VGAM RNA, and which when bound by VGAM2512 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2512 host target proteins.

[35134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2512 gene, herein designated VGAM GENE, on one or more VGAM2512 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35135] It is yet further appreciated that a function of VGAM2512 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2512 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2512 correlate with, and may be deduced from, the identity of the host target genes which VGAM2512 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35136] Nucleotide sequences of the VGAM2512 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2512 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2512 are further described hereinbelow with reference to Table 1.

[35137] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2512 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35138] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2513 (VGAM2513) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35139] VGAM2513 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2513 was detected is described hereinabove with reference to Figs. 2-8.

[35140] VGAM2513 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2513 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35141] VGAM2513 gene, herein designated VGAM GENE, encodes

a VGAM2513 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2513 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2513 precursor RNA is designated SEQ ID:2499, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2499 is located at position 157900 relative to the genome of Mouse cytomegalovirus 1.

[35142] VGAM2513 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35143] An enzyme complex designated DICER COMPLEX, dices the VGAM2513 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2513 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2513 RNA is designated SEQ ID:5224, and is provided hereinbelow with reference to the sequence listing part.

[35144] VGAM2513 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2513 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2513 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35145] VGAM2513 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2513 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2513 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2513 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2513 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35146] The complementary binding of VGAM2513 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2513 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2513

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2513 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35147] It is appreciated that VGAM2513 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2513 host target genes. The mRNA of each one of this plurality of VGAM2513 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2513 RNA, herein designated VGAM RNA, and which when bound by VGAM2513 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2513 host target proteins.

[35148] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2513 gene, herein designated VGAM GENE, on one or more VGAM2513 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35149] It is yet further appreciated that a function of VGAM2513 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2513 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2513 correlate with, and may be deduced from, the identity of the host target genes which VGAM2513 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35150] Nucleotide sequences of the VGAM2513 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2513 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2513 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2513 are further described hereinbelow with reference to Table 1.

[35151] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2513 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35152] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2514 (VGAM2514) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35153] VGAM2514 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2514 was detected is described hereinabove with reference to Figs. 2-8.

[35154] VGAM2514 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2514 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[35155] VGAM2514 gene, herein designated VGAM GENE, encodes a VGAM2514 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2514 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2514 precursor RNA is designated SEQ ID:2500, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2500 is located at position 127106 relative to the genome of Mouse cytomegalovirus 1.

[35156] VGAM2514 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35157] An enzyme complex designated DICER COMPLEX, dices the VGAM2514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2514 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2514 RNA is designated SEQ ID:5225, and is provided hereinbelow with reference to the sequence listing part.

[35158] VGAM2514 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2514 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2514 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35159] VGAM2514 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2514 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2514 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2514 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2514 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35160] The complementary binding of VGAM2514 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2514 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2514 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2514 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35161] It is appreciated that VGAM2514 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2514 host target genes. The mRNA of each one of this plurality of VGAM2514 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2514 RNA, herein designated VGAM RNA, and which when bound by VGAM2514 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2514 host target proteins.

[35162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2514 gene, herein designated VGAM GENE, on one or more VGAM2514 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35163] It is yet further appreciated that a function of VGAM2514 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2514 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2514 correlate with, and may be deduced from, the identity of the host target genes which VGAM2514 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35164] Nucleotide sequences of the VGAM2514 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2514 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2514 are further described hereinbelow with reference to Table 1.

[35165] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2514 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35166] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2515 (VGAM2515) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35167] VGAM2515 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2515 was detected is described hereinabove with reference to Figs. 2-8.

[35168] VGAM2515 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus

1. VGAM2515 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35169] VGAM2515 gene, herein designated VGAM GENE, encodes a VGAM2515 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2515 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2515 precursor RNA is designated SEQ ID:2501, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2501 is located at position 35144 relative to the genome of Mouse cytomegalovirus 1.

[35170] VGAM2515 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35171] An enzyme complex designated DICER COMPLEX, dices the VGAM2515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2515 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2515 RNA is designated SEQ ID:5226, and is provided hereinbelow with reference to the sequence listing part.

[35172] VGAM2515 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2515 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2515 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35173] VGAM2515 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2515 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2515 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2515 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2515 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35174] The complementary binding of VGAM2515 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2515 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2515 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2515 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35175] It is appreciated that VGAM2515 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2515 host target genes. The mRNA of each one of this plurality of VGAM2515 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2515 RNA, herein designated VGAM RNA, and which when bound by VGAM2515 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2515 host target proteins.

[35176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2515 gene, herein designated VGAM GENE, on one or more VGAM2515 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35177] It is yet further appreciated that a function of VGAM2515 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2515 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2515 correlate with, and may be deduced from, the identity of the host target genes which VGAM2515 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35178] Nucleotide sequences of the VGAM2515 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2515 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2515 are further described hereinbelow with reference to Table 1.

[35179] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2515 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35180] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2516 (VGAM2516) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35181] VGAM2516 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2516 was detected is described hereinabove with reference to Figs. 2-8.

[35182] VGAM2516 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2516 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35183] VGAM2516 gene, herein designated VGAM GENE, encodes a VGAM2516 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2516 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2516 precursor RNA is designated SEQ ID:2502, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2502 is located at position 84255 relative to the genome of Mouse cytomegalovirus 1.

[35184] VGAM2516 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35185] An enzyme complex designated DICER COMPLEX, dices the VGAM2516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2516 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2516 RNA is designated SEQ ID:5227, and is provided hereinbelow with reference to the sequence listing part.

[35186] VGAM2516 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35187] VGAM2516 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2516 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2516 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[35188] The complementary binding of VGAM2516 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2516 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2516 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35189] It is appreciated that VGAM2516 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2516 host target genes. The mRNA of each one of this plurality of VGAM2516 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2516 RNA, herein designated VGAM RNA, and which when bound by VGAM2516 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2516 host target proteins.

[35190] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2516 gene, herein designated VGAM GENE, on one or more VGAM2516 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35191] It is yet further appreciated that a function of VGAM2516 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2516 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2516 correlate with, and may be deduced from, the identity of the host target genes which VGAM2516 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[35192] Nucleotide sequences of the VGAM2516 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2516 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2516 are further described hereinbelow with reference to Table 1.

[35193] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2516 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35194] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2517 (VGAM2517) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35195] VGAM2517 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2517 was detected is described hereinabove with reference to Figs. 2-8.

[35196] VGAM2517 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2517 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35197] VGAM2517 gene, herein designated VGAM GENE, encodes a VGAM2517 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2517 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2517 precursor RNA is designated SEQ ID:2503, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2503 is located at position 158132 relative to the genome of Mouse cytomegalovirus 1.

[35198] VGAM2517 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35199] An enzyme complex designated DICER COMPLEX, dices the VGAM2517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2517 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM2517 RNA is designated SEQ ID:5228, and is provided hereinbelow with reference to the sequence listing part.

[35200] VGAM2517 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35201] VGAM2517 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2517 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2517 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35202] The complementary binding of VGAM2517 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2517 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2517 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35203] It is appreciated that VGAM2517 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2517 host target genes. The mRNA of each one of this plurality of VGAM2517 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2517 RNA, herein designated VGAM RNA, and which when bound by VGAM2517 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2517 host target proteins.

[35204] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2517 gene, herein designated VGAM GENE, on one or more VGAM2517 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35205] It is yet further appreciated that a function of VGAM2517 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2517 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2517 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2517 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35206] Nucleotide sequences of the VGAM2517 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2517 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2517 are further described hereinbelow with reference to Table 1.

[35207] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2517 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35208] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2518 (VGAM2518) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35209] VGAM2518 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2518 was detected is described hereinabove with reference to Figs. 2-8.

[35210] VGAM2518 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2518 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35211] VGAM2518 gene, herein designated VGAM GENE, encodes a VGAM2518 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2518 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2518 precursor RNA is designated SEQ ID:2504, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2504 is located at position 3872 relative to the genome of Mouse cytomegalovirus 1.

[35212] VGAM2518 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2518 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35213] An enzyme complex designated DICER COMPLEX, dices the VGAM2518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2518 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2518 RNA is designated SEQ ID:5229, and is provided hereinbelow with reference to the sequence listing part.

[35214] VGAM2518 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2518 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2518 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35215] VGAM2518 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2518 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2518 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2518 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2518 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35216] The complementary binding of VGAM2518 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2518 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2518 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2518 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35217] It is appreciated that VGAM2518 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2518 host target genes. The mRNA of each one of this plurality of VGAM2518 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2518 RNA, herein designated VGAM RNA, and which when bound by VGAM2518 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2518 host target proteins.

[35218] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2518 gene, herein designated VGAM GENE, on one or more VGAM2518 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35219] It is yet further appreciated that a function of VGAM2518 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2518 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2518

correlate with, and may be deduced from, the identity of the host target genes which VGAM2518 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35220] Nucleotide sequences of the VGAM2518 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2518 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2518 are further described hereinbelow with reference to Table 1.

[35221] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2518 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35222] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2519 (VGAM2519) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[35223] VGAM2519 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2519 was detected is described hereinabove with reference to Figs. 2-8.

[35224] VGAM2519 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2519 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35225] VGAM2519 gene, herein designated VGAM GENE, encodes a VGAM2519 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2519 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2519 precursor RNA is designated SEQ ID:2505, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2505 is located at position 59910 relative to the genome of Mouse cytomegalovirus 1.

[35226] VGAM2519 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35227] An enzyme complex designated DICER COMPLEX, dices the VGAM2519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2519 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2519 RNA is designated SEQ ID:5230, and is provided hereinbelow with reference to the sequence listing part.

[35228] VGAM2519 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2519 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2519 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35229] VGAM2519 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2519 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2519 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2519 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2519 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35230] The complementary binding of VGAM2519 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2519 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2519 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2519 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35231] It is appreciated that VGAM2519 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2519 host target genes. The mRNA of each one of this plurality of VGAM2519 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2519 RNA, herein designated VGAM RNA, and which when bound by VGAM2519 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2519 host target proteins.

[35232] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2519 gene, herein designated VGAM GENE, on one or more VGAM2519 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35233] It is yet further appreciated that a function of VGAM2519 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2519 include diagnosis, prevention and

treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2519 correlate with, and may be deduced from, the identity of the host target genes which VGAM2519 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35234] Nucleotide sequences of the VGAM2519 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2519 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2519 are further described hereinbelow with reference to Table 1.

[35235] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2519 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35236] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2520 (VGAM2520) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35237] VGAM2520 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2520 was detected is described hereinabove with reference to Figs. 2-8.

[35238] VGAM2520 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2520 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35239] VGAM2520 gene, herein designated VGAM GENE, encodes a VGAM2520 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2520 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2520 precursor RNA is designated SEQ ID:2506, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2506 is located at position 173931 relative to the genome of Mouse cytomegalovirus

1.

[35240] VGAM2520 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35241] An enzyme complex designated DICER COMPLEX, dices the VGAM2520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2520 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2520 RNA is designated SEQ ID:5231, and is provided hereinbelow with reference to the sequence listing part.

[35242] VGAM2520 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2520 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2520 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35243] VGAM2520 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2520 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2520 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2520 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2520 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35244] The complementary binding of VGAM2520 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2520 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2520 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2520 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35245] It is appreciated that VGAM2520 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2520 host target genes. The mRNA of each one of this plurality of VGAM2520 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2520 RNA, herein designated VGAM RNA, and which when bound by VGAM2520 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2520 host target proteins.

[35246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2520 gene, herein designated VGAM GENE, on one or more VGAM2520 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35247] It is yet further appreciated that a function of VGAM2520 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2520 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2520 correlate with, and may be deduced from, the identity of the host target genes which VGAM2520 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35248] Nucleotide sequences of the VGAM2520 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2520 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2520 are further described hereinbelow with reference to Table 1.

[35249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2520 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35250] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2521 (VGAM2521) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35251] VGAM2521 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2521 was detected is described hereinabove with reference to Figs. 2-8.

[35252] VGAM2521 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2521 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35253] VGAM2521 gene, herein designated VGAM GENE, encodes a VGAM2521 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2521 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2521 precursor RNA is designated SEQ ID:2507, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2507 is located at position 9443 relative to the genome of Mouse cytomegalovirus 1.

[35254] VGAM2521 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35255] An enzyme complex designated DICER COMPLEX, dices the VGAM2521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2521 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2521 RNA is designated SEQ ID:5232, and is provided hereinbelow with reference to the sequence

listing part.

[35256] VGAM2521 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35257] VGAM2521 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2521 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2521 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35258] The complementary binding of VGAM2521 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2521 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2521 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35259] It is appreciated that VGAM2521 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2521 host target genes. The mRNA of each one of this plurality of VGAM2521 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2521 RNA, herein designated VGAM RNA, and which when bound by VGAM2521 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2521 host target proteins.

[35260] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2521 gene, herein designated VGAM GENE, on one or more VGAM2521 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35261] It is yet further appreciated that a function of VGAM2521

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2521 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2521 correlate with, and may be deduced from, the identity of the host target genes which VGAM2521 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35262] Nucleotide sequences of the VGAM2521 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2521 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2521 are further described hereinbelow with reference to Table 1.

[35263] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2521 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35264] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2522 (VGAM2522) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35265] VGAM2522 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2522 was detected is described hereinabove with reference to Figs. 2-8.

[35266] VGAM2522 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2522 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35267] VGAM2522 gene, herein designated VGAM GENE, encodes a VGAM2522 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2522 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2522 precursor RNA is designated SEQ ID:2508, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2508 is located at position 116189 relative to the genome of Mouse cytomegalovirus 1.

[35268] VGAM2522 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35269] An enzyme complex designated DICER COMPLEX, dices the VGAM2522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2522 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM2522 RNA is designated SEQ ID:5233, and is provided hereinbelow with reference to the sequence listing part.

[35270] VGAM2522 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35271] VGAM2522 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2522 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2522 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35272] The complementary binding of VGAM2522 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2522 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2522 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35273] It is appreciated that VGAM2522 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2522 host target genes. The mRNA of

each one of this plurality of VGAM2522 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2522 RNA, herein designated VGAM RNA, and which when bound by VGAM2522 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2522 host target proteins.

[35274] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2522 gene, herein designated VGAM GENE, on one or more VGAM2522 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35275] It is yet further appreciated that a function of VGAM2522 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2522 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2522 correlate with, and may be deduced from, the identity of the host target genes which VGAM2522 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35276] Nucleotide sequences of the VGAM2522 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2522 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2522 are further described hereinbelow with reference to Table 1.

[35277] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2522 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35278] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2523 (VGAM2523) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35279] VGAM2523 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2523 was detected is described hereinabove with reference to Figs. 2-8.

[35280] VGAM2523 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2523 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35281] VGAM2523 gene, herein designated VGAM GENE, encodes a VGAM2523 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2523 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2523 precursor RNA is designated SEQ ID:2509, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2509 is located at position 122311 relative to the genome of Mouse cytomegalovirus 1.

[35282] VGAM2523 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35283] An enzyme complex designated DICER COMPLEX, dices the VGAM2523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2523 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2523 RNA is designated SEQ ID:5234, and is provided hereinbelow with reference to the sequence listing part.

[35284] VGAM2523 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35285] VGAM2523 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2523 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2523 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35286] The complementary binding of VGAM2523 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2523 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2523 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35287] It is appreciated that VGAM2523 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2523 host target genes. The mRNA of each one of this plurality of VGAM2523 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2523 RNA, herein designated VGAM RNA, and which when bound by VGAM2523 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2523 host target proteins.

[35288] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2523 gene, herein designated VGAM GENE, on one or more VGAM2523 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35289] It is yet further appreciated that a function of VGAM2523 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2523 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2523 correlate with, and may be deduced from, the identity of the host target genes which VGAM2523 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35290] Nucleotide sequences of the VGAM2523 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2523 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2523 are further described hereinbelow with reference to Table 1.

[35291] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2523 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35292] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2524 (VGAM2524) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35293] VGAM2524 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2524 was detected is described hereinabove with reference to Figs. 2-8.

[35294] VGAM2524 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2524 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35295] VGAM2524 gene, herein designated VGAM GENE, encodes a VGAM2524 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2524 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2524 precursor RNA is designated SEQ ID:2510, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2510 is located at position 180093 relative to the genome of Mouse cytomegalovirus 1.

[35296] VGAM2524 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35297] An enzyme complex designated DICER COMPLEX, dices the VGAM2524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2524 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2524 RNA is designated SEQ ID:5235, and is provided hereinbelow with reference to the sequence listing part.

[35298] VGAM2524 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35299] VGAM2524 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2524 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2524 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35300] The complementary binding of VGAM2524 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2524 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2524 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[35301] It is appreciated that VGAM2524 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2524 host target genes. The mRNA of each one of this plurality of VGAM2524 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2524 RNA, herein designated VGAM RNA, and which when bound by VGAM2524 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2524 host target proteins.

[35302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2524 gene, herein designated VGAM GENE, on one or more VGAM2524 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35303] It is yet further appreciated that a function of VGAM2524 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2524 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2524 correlate with, and may be deduced from, the identity of the host target genes which VGAM2524 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35304] Nucleotide sequences of the VGAM2524 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2524 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2524 are further described hereinbelow with reference to Table 1.

[35305] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2524 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35306] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2525 (VGAM2525) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35307] VGAM2525 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2525 was detected is described hereinabove with reference to Figs. 2-8.

[35308] VGAM2525 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2525 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35309] VGAM2525 gene, herein designated VGAM GENE, encodes a VGAM2525 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2525 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2525 precursor RNA is designated SEQ ID:2511, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2511 is located at position 213327 relative to the genome of Mouse cytomegalovirus 1.

[35310] VGAM2525 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35311] An enzyme complex designated DICER COMPLEX, dices the VGAM2525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2525 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2525 RNA is designated SEQ ID:5236, and is provided hereinbelow with reference to the sequence listing part.

[35312] VGAM2525 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2525 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2525 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35313] VGAM2525 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2525 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2525 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2525 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2525 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35314] The complementary binding of VGAM2525 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2525 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2525 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2525 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35315] It is appreciated that VGAM2525 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2525 host target genes. The mRNA of each one of this plurality of VGAM2525 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2525 RNA, herein designated VGAM RNA, and which when bound by VGAM2525 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2525 host target proteins.

[35316] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2525 gene, herein designated VGAM GENE, on one or more VGAM2525 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35317] It is yet further appreciated that a function of VGAM2525 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2525 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2525 correlate with, and may be deduced from, the identity of the host target genes which VGAM2525 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35318] Nucleotide sequences of the VGAM2525 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2525 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2525 are further

described hereinbelow with reference to Table 1.

[35319] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2525 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35320] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2526 (VGAM2526) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35321] VGAM2526 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2526 was detected is described hereinabove with reference to Figs. 2-8.

[35322] VGAM2526 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2526 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35323] VGAM2526 gene, herein designated VGAM GENE, encodes a VGAM2526 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2526 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2526 precursor RNA is designated SEQ ID:2512, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2512 is located at position 85449 relative to the genome of Mouse cytomegalovirus 1.

[35324] VGAM2526 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35325] An enzyme complex designated DICER COMPLEX, dices

the VGAM2526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2526 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2526 RNA is designated SEQ ID:5237, and is provided hereinbelow with reference to the sequence listing part.

[35326] VGAM2526 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2526 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2526 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35327] VGAM2526 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2526 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2526 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2526 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2526 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35328] The complementary binding of VGAM2526 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2526 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2526 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2526 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35329] It is appreciated that VGAM2526 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2526 host target genes. The mRNA of each one of this plurality of VGAM2526 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2526 RNA, herein designated VGAM RNA, and which when bound by VGAM2526 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2526 host target proteins.

[35330] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2526 gene, herein designated VGAM GENE, on one or more VGAM2526 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35331] It is yet further appreciated that a function of VGAM2526 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2526 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2526 correlate with, and may be deduced from, the identity of the host target genes which VGAM2526 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35332] Nucleotide sequences of the VGAM2526 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2526 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2526 are further described hereinbelow with reference to Table 1.

[35333] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2526 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35334] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2527 (VGAM2527) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35335] VGAM2527 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2527 was detected is described hereinabove with reference to Figs. 2-8.

[35336] VGAM2527 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse cytomegalovirus 1. VGAM2527 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[35337] VGAM2527 gene, herein designated VGAM GENE, encodes a VGAM2527 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2527 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2527 precursor RNA is designated SEQ ID:2513, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2513 is located at position 157147 relative to the genome of Mouse cytomegalovirus 1.

[35338] VGAM2527 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[35339] An enzyme complex designated DICER COMPLEX, dices the VGAM2527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2527 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2527 RNA is designated SEQ ID:5238, and is provided hereinbelow with reference to the sequence listing part.

[35340] VGAM2527 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35341] VGAM2527 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2527 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2527 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35342] The complementary binding of VGAM2527 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2527 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2527 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35343] It is appreciated that VGAM2527 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2527 host target genes. The mRNA of each one of this plurality of VGAM2527 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2527 RNA, herein designated VGAM RNA, and which when bound by VGAM2527 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2527 host target proteins.

[35344] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2527 gene, herein designated VGAM GENE, on one or more VGAM2527 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35345] It is yet further appreciated that a function of VGAM2527 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2527 include diagnosis, prevention and treatment of viral infection by Mouse cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2527 correlate with, and may be deduced from, the identity of the host target genes which VGAM2527 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35346] Nucleotide sequences of the VGAM2527 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2527 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2527 are further described hereinbelow with reference to Table 1.

[35347] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2527 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35348] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2528 (VGAM2528) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35349] VGAM2528 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2528 was detected is described hereinabove with reference to Figs. 2-8.

[35350] VGAM2528 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cowpox virus. VGAM2528 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35351] VGAM2528 gene, herein designated VGAM GENE, encodes a VGAM2528 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2528 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2528 precursor RNA is designated SEQ ID:2514, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2514 is located at position 17101 relative to the genome of Cowpox virus.

[35352] VGAM2528 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35353] An enzyme complex designated DICER COMPLEX, dices the VGAM2528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2528 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2528 RNA is designated SEQ ID:5239, and is provided hereinbelow with reference to the sequence listing part.

[35354] VGAM2528 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35355] VGAM2528 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2528 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2528 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35356] The complementary binding of VGAM2528 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2528 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2528 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35357] It is appreciated that VGAM2528 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2528 host target genes. The mRNA of each one of this plurality of VGAM2528 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2528 RNA, herein designated VGAM RNA, and which when bound by VGAM2528 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2528 host target proteins.

[35358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2528 gene, herein designated VGAM GENE, on one or more VGAM2528 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35359] It is yet further appreciated that a function of VGAM2528 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2528 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2528 correlate with, and may be deduced from, the identity of the host target genes which VGAM2528 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35360] Nucleotide sequences of the VGAM2528 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2528 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2528 are further described hereinbelow with reference to Table 1.

[35361] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2528 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35362] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2529 (VGAM2529) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35363] VGAM2529 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2529 was detected is described hereinabove with reference to Figs. 2-8.

[35364] VGAM2529 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper ringspot virus. VGAM2529 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35365] VGAM2529 gene, herein designated VGAM GENE, encodes a VGAM2529 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2529 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2529 precursor RNA is designated SEQ ID:2515, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2515 is located at position 4230 relative to the genome of Pepper ringspot virus.

[35366] VGAM2529 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35367] An enzyme complex designated DICER COMPLEX, dices the VGAM2529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2529 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2529 RNA is designated SEQ ID:5240, and is provided hereinbelow with reference to the sequence listing part.

[35368] VGAM2529 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[35369] VGAM2529 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2529 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2529 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35370] The complementary binding of VGAM2529 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2529 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2529 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35371] It is appreciated that VGAM2529 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2529 host target genes. The mRNA of each one of this plurality of VGAM2529 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2529 RNA, herein designated VGAM RNA, and which when bound by VGAM2529 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2529 host target proteins.

[35372] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2529 gene, herein designated VGAM GENE, on one

or more VGAM2529 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35373] It is yet further appreciated that a function of VGAM2529 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2529 include diagnosis, prevention and treatment of viral infection by Pepper ringspot virus. Specific functions, and accordingly utilities, of VGAM2529 correlate with, and may be deduced from, the identity of the host target genes which VGAM2529 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35374] Nucleotide sequences of the VGAM2529 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2529 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2529 are further described hereinbelow with reference to Table 1.

[35375] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2529 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35376] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2530 (VGAM2530) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35377] VGAM2530 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2530 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[35378] VGAM2530 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper ringspot virus. VGAM2530 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35379] VGAM2530 gene, herein designated VGAM GENE, encodes a VGAM2530 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2530 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2530 precursor RNA is designated SEQ ID:2516, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2516 is located at position 1886 relative to the genome of Pepper ringspot virus.

[35380] VGAM2530 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35381] An enzyme complex designated DICER COMPLEX, dices the VGAM2530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2530 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2530 RNA is designated SEQ ID:5241, and is provided hereinbelow with reference to the sequence listing part.

[35382] VGAM2530 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35383] VGAM2530 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2530 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2530 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[35384] The complementary binding of VGAM2530 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2530 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2530 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35385] It is appreciated that VGAM2530 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2530 host target genes. The mRNA of each one of this plurality of VGAM2530 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2530 RNA, herein designated VGAM RNA, and which when bound by VGAM2530 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2530 host target proteins.

[35386] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2530 gene, herein designated VGAM GENE, on one or more VGAM2530 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35387] It is yet further appreciated that a function of VGAM2530 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2530 include diagnosis, prevention and treatment of viral infection by Pepper ringspot virus. Specific functions, and accordingly utilities, of VGAM2530 correlate with, and may be deduced from, the identity of the host target genes which VGAM2530 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[35388] Nucleotide sequences of the VGAM2530 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2530 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2530 are further described hereinbelow with reference to Table 1.

[35389] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2530 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35390] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2531 (VGAM2531) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35391] VGAM2531 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2531 was detected is described hereinabove with reference to Figs. 2-8.

[35392] VGAM2531 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper ringspot virus. VGAM2531 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35393] VGAM2531 gene, herein designated VGAM GENE, encodes a VGAM2531 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2531 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2531 precursor RNA is designated SEQ ID:2517, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2517 is located at position 2562 relative to the genome of Pepper ringspot virus.

[35394] VGAM2531 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35395] An enzyme complex designated DICER COMPLEX, dices the VGAM2531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2531 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2531 RNA is designated SEQ ID:5242, and is provided hereinbelow with reference to the sequence listing part.

[35396] VGAM2531 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35397] VGAM2531 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2531 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2531 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35398] The complementary binding of VGAM2531 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2531 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2531 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35399] It is appreciated that VGAM2531 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2531 host target genes. The mRNA of each one of this plurality of VGAM2531 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2531 RNA, herein designated VGAM RNA, and which when bound by VGAM2531 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2531 host target proteins.

[35400] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2531 gene, herein designated VGAM GENE, on one or more VGAM2531 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35401] It is yet further appreciated that a function of VGAM2531 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2531 include diagnosis, prevention and treatment of viral infection by Pepper ringspot virus. Specific functions, and accordingly utilities, of VGAM2531 correlate with, and may be deduced from, the identity of the host target genes which VGAM2531 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[35402] Nucleotide sequences of the VGAM2531 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2531 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2531 are further described hereinbelow with reference to Table 1.

[35403] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2531 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35404] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2532 (VGAM2532) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35405] VGAM2532 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2532 was detected is described hereinabove with reference to Figs. 2-8.

[35406] VGAM2532 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rio Bravo virus. VGAM2532 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35407] VGAM2532 gene, herein designated VGAM GENE, encodes a VGAM2532 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2532 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2532 precursor RNA is designated SEQ ID:2518, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2518 is located at position 643 relative to the genome of Rio Bravo virus.

[35408] VGAM2532 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35409] An enzyme complex designated DICER COMPLEX, dices the VGAM2532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2532 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2532 RNA is designated SEQ ID:5243, and is provided hereinbelow with reference to the sequence listing part.

[35410] VGAM2532 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2532 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2532 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35411] VGAM2532 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2532 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2532 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2532 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2532 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35412] The complementary binding of VGAM2532 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2532 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2532 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2532 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35413] It is appreciated that VGAM2532 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2532 host target genes. The mRNA of each one of this plurality of VGAM2532 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2532 RNA, herein designated VGAM RNA, and which when bound by VGAM2532 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2532 host target proteins.

[35414] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2532 gene, herein designated VGAM GENE, on one or more VGAM2532 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35415] It is yet further appreciated that a function of VGAM2532 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2532 include diagnosis, prevention and treatment of viral infection by Rio Bravo virus. Specific functions, and accordingly utilities, of VGAM2532 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2532 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35416] Nucleotide sequences of the VGAM2532 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2532 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2532 are further described hereinbelow with reference to Table 1.

[35417] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2532 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35418] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2533 (VGAM2533) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35419] VGAM2533 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2533 was detected is described hereinabove with reference to Figs. 2-8.

[35420] VGAM2533 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rio Bravo virus. VGAM2533 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35421] VGAM2533 gene, herein designated VGAM GENE, encodes a VGAM2533 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2533 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2533 precursor RNA is designated SEQ ID:2519, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2519 is located at position 3063 relative to the genome of Rio Bravo virus.

[35422] VGAM2533 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2533 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35423] An enzyme complex designated DICER COMPLEX, dices the VGAM2533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2533 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2533 RNA is designated SEQ ID:5244, and is provided hereinbelow with reference to the sequence listing part.

[35424] VGAM2533 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2533 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2533 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35425] VGAM2533 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2533 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2533 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2533 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2533 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35426] The complementary binding of VGAM2533 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2533 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2533 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2533 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35427] It is appreciated that VGAM2533 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2533 host target genes. The mRNA of each one of this plurality of VGAM2533 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2533 RNA, herein designated VGAM RNA, and which when bound by VGAM2533 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2533 host target proteins.

[35428] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2533 gene, herein designated VGAM GENE, on one or more VGAM2533 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35429] It is yet further appreciated that a function of VGAM2533 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2533 include diagnosis, prevention and treatment of viral infection by Rio Bravo virus. Specific functions, and accordingly utilities, of VGAM2533 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2533 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35430] Nucleotide sequences of the VGAM2533 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2533 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2533 are further described hereinbelow with reference to Table 1.

[35431] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2533 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35432] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2534 (VGAM2534) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[35433] VGAM2534 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2534 was detected is described hereinabove with reference to Figs. 2-8.

[35434] VGAM2534 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rio Bravo virus. VGAM2534 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35435] VGAM2534 gene, herein designated VGAM GENE, encodes a VGAM2534 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2534 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2534 precursor RNA is designated SEQ ID:2520, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2520 is located at position 7314 relative to the genome of Rio Bravo virus.

[35436] VGAM2534 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2534 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35437] An enzyme complex designated DICER COMPLEX, dices the VGAM2534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2534 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM2534 RNA is designated SEQ ID:5245, and is provided hereinbelow with reference to the sequence listing part.

[35438] VGAM2534 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2534 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2534 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35439] VGAM2534 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2534 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2534 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2534 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2534 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35440] The complementary binding of VGAM2534 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2534 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2534 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2534 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35441] It is appreciated that VGAM2534 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2534 host target genes. The mRNA of each one of this plurality of VGAM2534 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2534 RNA, herein designated VGAM RNA, and which when bound by VGAM2534 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2534 host target proteins.

[35442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2534 gene, herein designated VGAM GENE, on one or more VGAM2534 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35443] It is yet further appreciated that a function of VGAM2534 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2534 include diagnosis, prevention and treatment of viral infection by Rio Bravo virus. Specific

functions, and accordingly utilities, of VGAM2534 correlate with, and may be deduced from, the identity of the host target genes which VGAM2534 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35444] Nucleotide sequences of the VGAM2534 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2534 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2534 are further described hereinbelow with reference to Table 1.

[35445] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2534 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35446] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2535 (VGAM2535) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[35447] VGAM2535 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2535 was detected is described hereinabove with reference to Figs. 2-8.

[35448] VGAM2535 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rio Bravo virus. VGAM2535 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35449] VGAM2535 gene, herein designated VGAM GENE, encodes a VGAM2535 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2535 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2535 precursor RNA is designated SEQ ID:2521, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2521 is located at position 5612 relative to the genome of Rio Bravo virus.

[35450] VGAM2535 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35451] An enzyme complex designated DICER COMPLEX, dices the VGAM2535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2535 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2535 RNA is designated SEQ ID:5246, and is provided hereinbelow with reference to the sequence listing part.

[35452] VGAM2535 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2535 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2535 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35453] VGAM2535 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2535 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2535 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2535 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2535 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35454] The complementary binding of VGAM2535 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2535 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2535 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2535 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35455] It is appreciated that VGAM2535 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2535 host target genes. The mRNA of each one of this plurality of VGAM2535 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2535 RNA, herein designated VGAM RNA, and which when bound by VGAM2535 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2535 host target proteins.

[35456] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2535 gene, herein designated VGAM GENE, on one or more VGAM2535 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35457] It is yet further appreciated that a function of VGAM2535 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2535 include diagnosis, prevention and

treatment of viral infection by Rio Bravo virus. Specific functions, and accordingly utilities, of VGAM2535 correlate with, and may be deduced from, the identity of the host target genes which VGAM2535 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35458] Nucleotide sequences of the VGAM2535 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2535 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2535 are further described hereinbelow with reference to Table 1.

[35459] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2535 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35460] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2536 (VGAM2536) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35461] VGAM2536 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2536 was detected is described hereinabove with reference to Figs. 2-8.

[35462] VGAM2536 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus Reindeer-1. VGAM2536 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35463] VGAM2536 gene, herein designated VGAM GENE, encodes a VGAM2536 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2536 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2536 precursor RNA is designated SEQ ID:2522, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2522 is located at position 4448 relative to the genome of pestivirus Reindeer-1.

[35464] VGAM2536 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35465] An enzyme complex designated DICER COMPLEX, dices the VGAM2536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2536 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2536 RNA is designated SEQ ID:5247, and is provided hereinbelow with reference to the sequence listing part.

[35466] VGAM2536 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35467] VGAM2536 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2536 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2536 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35468] The complementary binding of VGAM2536 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2536 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2536 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35469] It is appreciated that VGAM2536 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2536 host target genes. The mRNA of each one of this plurality of VGAM2536 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2536 RNA, herein designated VGAM

RNA, and which when bound by VGAM2536 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2536 host target proteins.

[35470] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2536 gene, herein designated VGAM GENE, on one or more VGAM2536 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35471] It is yet further appreciated that a function of VGAM2536 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2536 include diagnosis, prevention and treatment of viral infection by pestivirus Reindeer-1. Specific functions, and accordingly utilities, of VGAM2536 correlate with, and may be deduced from, the identity of the host target genes which VGAM2536 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35472] Nucleotide sequences of the VGAM2536 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2536 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2536 are further described hereinbelow with reference to Table 1.

[35473] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2536 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35474] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2537 (VGAM2537) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35475] VGAM2537 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2537 was detected is described hereinabove with reference to Figs. 2-8.

[35476] VGAM2537 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus Reindeer-1. VGAM2537 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35477] VGAM2537 gene, herein designated VGAM GENE, encodes a VGAM2537 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2537 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2537 precursor RNA is designated SEQ ID:2523, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2523 is located at position 4253

relative to the genome of pestivirus Reindeer-1.

[35478] VGAM2537 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35479] An enzyme complex designated DICER COMPLEX, dices the VGAM2537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2537 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2537 RNA is designated SEQ ID:5248, and is provided hereinbelow with reference to the sequence listing part.

[35480] VGAM2537 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35481] VGAM2537 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2537 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2537 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35482] The complementary binding of VGAM2537 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2537 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2537 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35483] It is appreciated that VGAM2537 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2537 host target genes. The mRNA of each one of this plurality of VGAM2537 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2537 RNA, herein designated VGAM RNA, and which when bound by VGAM2537 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2537 host target proteins.

[35484] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2537 gene, herein designated VGAM GENE, on one or more VGAM2537 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35485] It is yet further appreciated that a function of VGAM2537 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2537 include diagnosis, prevention and treatment of viral infection by pestivirus Reindeer-1. Specific functions, and accordingly utilities, of VGAM2537 correlate with, and may be deduced from, the identity of the host target genes which VGAM2537 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35486] Nucleotide sequences of the VGAM2537 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2537 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2537 are further described hereinbelow with reference to Table 1.

[35487] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2537 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35488] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2538 (VGAM2538) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35489] VGAM2538 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2538 was detected is described hereinabove with reference to Figs. 2-8.

[35490] VGAM2538 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus Reindeer-1. VGAM2538 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35491] VGAM2538 gene, herein designated VGAM GENE, encodes a VGAM2538 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2538 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2538 precursor RNA is designated SEQ ID:2524, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2524 is located at position 2796 relative to the genome of pestivirus Reindeer-1.

[35492] VGAM2538 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35493] An enzyme complex designated DICER COMPLEX, dices the VGAM2538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2538 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2538 RNA is designated SEQ ID:5249, and is provided hereinbelow with reference to the sequence

listing part.

[35494] VGAM2538 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2538 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2538 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35495] VGAM2538 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2538 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2538 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2538 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2538 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35496] The complementary binding of VGAM2538 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2538 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2538 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2538 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35497] It is appreciated that VGAM2538 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2538 host target genes. The mRNA of each one of this plurality of VGAM2538 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2538 RNA, herein designated VGAM RNA, and which when bound by VGAM2538 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2538 host target proteins.

[35498] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2538 gene, herein designated VGAM GENE, on one or more VGAM2538 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35499] It is yet further appreciated that a function of VGAM2538

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2538 include diagnosis, prevention and treatment of viral infection by pestivirus Reindeer-1. Specific functions, and accordingly utilities, of VGAM2538 correlate with, and may be deduced from, the identity of the host target genes which VGAM2538 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35500] Nucleotide sequences of the VGAM2538 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2538 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2538 are further described hereinbelow with reference to Table 1.

[35501] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2538 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35502] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2539 (VGAM2539) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35503] VGAM2539 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2539 was detected is described hereinabove with reference to Figs. 2-8.

[35504] VGAM2539 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus Giraffe-1. VGAM2539 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35505] VGAM2539 gene, herein designated VGAM GENE, encodes a VGAM2539 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2539 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2539 precursor RNA is designated SEQ ID:2525, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2525 is located at position 1159 relative to the genome of pestivirus Giraffe-1.

[35506] VGAM2539 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35507] An enzyme complex designated DICER COMPLEX, dices the VGAM2539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2539 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2539 RNA is designated SEQ ID:5250, and

is provided hereinbelow with reference to the sequence listing part.

[35508] VGAM2539 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35509] VGAM2539 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2539 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2539 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35510] The complementary binding of VGAM2539 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2539 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2539 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35511] It is appreciated that VGAM2539 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2539 host target genes. The mRNA of each one of this plurality of VGAM2539 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2539 RNA, herein designated VGAM RNA, and which when bound by VGAM2539 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2539 host target proteins.

[35512] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2539 gene, herein designated VGAM GENE, on one or more VGAM2539 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35513] It is yet further appreciated that a function of VGAM2539 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2539 include diagnosis, prevention and treatment of viral infection by pestivirus Giraffe-1. Specific functions, and accordingly utilities, of VGAM2539 correlate with, and may be deduced from, the identity of the host target genes which VGAM2539 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35514] Nucleotide sequences of the VGAM2539 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2539 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2539 are further described hereinbelow with reference to Table 1.

[35515] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2539 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35516] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2540 (VGAM2540) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35517] VGAM2540 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2540 was detected is described hereinabove with reference to Figs. 2-8.

[35518] VGAM2540 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus Giraffe-1. VGAM2540 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35519] VGAM2540 gene, herein designated VGAM GENE, encodes a VGAM2540 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2540 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2540 precur-

sor RNA is designated SEQ ID:2526, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2526 is located at position 4480 relative to the genome of pestivirus Giraffe-1.

[35520] VGAM2540 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35521] An enzyme complex designated DICER COMPLEX, dices the VGAM2540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2540 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM2540 RNA is designated SEQ ID:5251, and is provided hereinbelow with reference to the sequence listing part.

[35522] VGAM2540 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2540 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2540 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35523] VGAM2540 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2540 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2540 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2540 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2540 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35524] The complementary binding of VGAM2540 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2540 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2540 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2540 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35525] It is appreciated that VGAM2540 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2540 host target genes. The mRNA of

each one of this plurality of VGAM2540 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2540 RNA, herein designated VGAM RNA, and which when bound by VGAM2540 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2540 host target proteins.

[35526] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2540 gene, herein designated VGAM GENE, on one or more VGAM2540 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35527] It is yet further appreciated that a function of VGAM2540 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2540 include diagnosis, prevention and treatment of viral infection by pestivirus Giraffe-1. Specific functions, and accordingly utilities, of VGAM2540 correlate with, and may be deduced from, the identity of the host target genes which VGAM2540 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35528] Nucleotide sequences of the VGAM2540 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2540 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2540 are further described hereinbelow with reference to Table 1.

[35529] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2540 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35530] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2541 (VGAM2541) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35531] VGAM2541 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2541 was detected is described hereinabove with reference to Figs. 2-8.

[35532] VGAM2541 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat virus. VGAM2541 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35533] VGAM2541 gene, herein designated VGAM GENE, encodes a VGAM2541 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2541 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2541 precur-

sor RNA is designated SEQ ID:2527, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2527 is located at position 1698 relative to the genome of Langat virus.

[35534] VGAM2541 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35535] An enzyme complex designated DICER COMPLEX, dices the VGAM2541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2541 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM2541 RNA is designated SEQ ID:5252, and is provided hereinbelow with reference to the sequence listing part.

[35536] VGAM2541 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35537] VGAM2541 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2541 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2541 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35538] The complementary binding of VGAM2541 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2541 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2541 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35539] It is appreciated that VGAM2541 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2541 host target genes. The mRNA of

each one of this plurality of VGAM2541 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2541 RNA, herein designated VGAM RNA, and which when bound by VGAM2541 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2541 host target proteins.

[35540] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2541 gene, herein designated VGAM GENE, on one or more VGAM2541 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35541] It is yet further appreciated that a function of VGAM2541 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2541 include diagnosis, prevention and treatment of viral infection by Langat virus. Specific functions, and accordingly utilities, of VGAM2541 correlate with, and may be deduced from, the identity of the host target genes which VGAM2541 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35542] Nucleotide sequences of the VGAM2541 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2541 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2541 are further described hereinbelow with reference to Table 1.

[35543] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2541 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35544] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2542 (VGAM2542) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35545] VGAM2542 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2542 was detected is described hereinabove with reference to Figs. 2-8.

[35546] VGAM2542 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat virus. VGAM2542 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35547] VGAM2542 gene, herein designated VGAM GENE, encodes a VGAM2542 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2542 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2542 precur-

sor RNA is designated SEQ ID:2528, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2528 is located at position 9086 relative to the genome of Langat virus.

[35548] VGAM2542 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35549] An enzyme complex designated DICER COMPLEX, dices the VGAM2542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2542 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM2542 RNA is designated SEQ ID:5253, and is provided hereinbelow with reference to the sequence listing part.

[35550] VGAM2542 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35551] VGAM2542 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2542 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2542 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35552] The complementary binding of VGAM2542 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2542 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2542 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35553] It is appreciated that VGAM2542 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2542 host target genes. The mRNA of

each one of this plurality of VGAM2542 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2542 RNA, herein designated VGAM RNA, and which when bound by VGAM2542 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2542 host target proteins.

[35554] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2542 gene, herein designated VGAM GENE, on one or more VGAM2542 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35555] It is yet further appreciated that a function of VGAM2542 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2542 include diagnosis, prevention and treatment of viral infection by Langat virus. Specific functions, and accordingly utilities, of VGAM2542 correlate with, and may be deduced from, the identity of the host target genes which VGAM2542 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35556] Nucleotide sequences of the VGAM2542 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2542 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2542 are further described hereinbelow with reference to Table 1.

[35557] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2542 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35558] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2543 (VGAM2543) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35559] VGAM2543 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2543 was detected is described hereinabove with reference to Figs. 2-8.

[35560] VGAM2543 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat virus. VGAM2543 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35561] VGAM2543 gene, herein designated VGAM GENE, encodes a VGAM2543 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2543 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2543 precur-

sor RNA is designated SEQ ID:2529, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2529 is located at position 976 relative to the genome of Langat virus.

[35562] VGAM2543 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35563] An enzyme complex designated DICER COMPLEX, dices the VGAM2543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2543 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM2543 RNA is designated SEQ ID:5254, and is provided hereinbelow with reference to the sequence listing part.

[35564] VGAM2543 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35565] VGAM2543 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2543 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2543 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35566] The complementary binding of VGAM2543 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2543 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2543 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35567] It is appreciated that VGAM2543 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2543 host target genes. The mRNA of

each one of this plurality of VGAM2543 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2543 RNA, herein designated VGAM RNA, and which when bound by VGAM2543 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2543 host target proteins.

[35568] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2543 gene, herein designated VGAM GENE, on one or more VGAM2543 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35569] It is yet further appreciated that a function of VGAM2543 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2543 include diagnosis, prevention and treatment of viral infection by Langat virus. Specific functions, and accordingly utilities, of VGAM2543 correlate with, and may be deduced from, the identity of the host target genes which VGAM2543 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35570] Nucleotide sequences of the VGAM2543 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2543 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2543 are further described hereinbelow with reference to Table 1.

[35571] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2543 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35572] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2544 (VGAM2544) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35573] VGAM2544 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2544 was detected is described hereinabove with reference to Figs. 2-8.

[35574] VGAM2544 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat virus. VGAM2544 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35575] VGAM2544 gene, herein designated VGAM GENE, encodes a VGAM2544 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2544 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2544 precur-

sor RNA is designated SEQ ID:2530, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2530 is located at position 9387 relative to the genome of Langat virus.

[35576] VGAM2544 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35577] An enzyme complex designated DICER COMPLEX, dices the VGAM2544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2544 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2544 RNA is designated SEQ ID:5255, and is provided hereinbelow with reference to the sequence listing part.

[35578] VGAM2544 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35579] VGAM2544 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2544 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2544 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35580] The complementary binding of VGAM2544 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2544 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2544 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35581] It is appreciated that VGAM2544 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2544 host target genes. The mRNA of

each one of this plurality of VGAM2544 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2544 RNA, herein designated VGAM RNA, and which when bound by VGAM2544 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2544 host target proteins.

[35582] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2544 gene, herein designated VGAM GENE, on one or more VGAM2544 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35583] It is yet further appreciated that a function of VGAM2544 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2544 include diagnosis, prevention and treatment of viral infection by Langat virus. Specific functions, and accordingly utilities, of VGAM2544 correlate with, and may be deduced from, the identity of the host target genes which VGAM2544 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35584] Nucleotide sequences of the VGAM2544 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2544 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2544 are further described hereinbelow with reference to Table 1.

[35585] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2544 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35586] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2545 (VGAM2545) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35587] VGAM2545 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2545 was detected is described hereinabove with reference to Figs. 2-8.

[35588] VGAM2545 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat virus. VGAM2545 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35589] VGAM2545 gene, herein designated VGAM GENE, encodes a VGAM2545 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2545 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2545 precur-

sor RNA is designated SEQ ID:2531, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2531 is located at position 3636 relative to the genome of Langat virus.

[35590] VGAM2545 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35591] An enzyme complex designated DICER COMPLEX, dices the VGAM2545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2545 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM2545 RNA is designated SEQ ID:5256, and is provided hereinbelow with reference to the sequence listing part.

[35592] VGAM2545 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35593] VGAM2545 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2545 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2545 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35594] The complementary binding of VGAM2545 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2545 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2545 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35595] It is appreciated that VGAM2545 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2545 host target genes. The mRNA of

each one of this plurality of VGAM2545 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2545 RNA, herein designated VGAM RNA, and which when bound by VGAM2545 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2545 host target proteins.

[35596] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2545 gene, herein designated VGAM GENE, on one or more VGAM2545 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35597] It is yet further appreciated that a function of VGAM2545 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2545 include diagnosis, prevention and treatment of viral infection by Langat virus. Specific functions, and accordingly utilities, of VGAM2545 correlate with, and may be deduced from, the identity of the host target genes which VGAM2545 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35598] Nucleotide sequences of the VGAM2545 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2545 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2545 are further described hereinbelow with reference to Table 1.

[35599] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2545 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35600] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2546 (VGAM2546) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35601] VGAM2546 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2546 was detected is described hereinabove with reference to Figs. 2-8.

[35602] VGAM2546 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat virus. VGAM2546 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35603] VGAM2546 gene, herein designated VGAM GENE, encodes a VGAM2546 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2546 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2546 precur-

sor RNA is designated SEQ ID:2532, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2532 is located at position 3420 relative to the genome of Langat virus.

[35604] VGAM2546 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35605] An enzyme complex designated DICER COMPLEX, dices the VGAM2546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2546 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide se-

quence of VGAM2546 RNA is designated SEQ ID:5257, and is provided hereinbelow with reference to the sequence listing part.

[35606] VGAM2546 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2546 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2546 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35607] VGAM2546 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2546 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2546 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2546 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2546 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35608] The complementary binding of VGAM2546 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2546 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2546 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2546 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35609] It is appreciated that VGAM2546 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2546 host target genes. The mRNA of

each one of this plurality of VGAM2546 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2546 RNA, herein designated VGAM RNA, and which when bound by VGAM2546 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2546 host target proteins.

[35610] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2546 gene, herein designated VGAM GENE, on one or more VGAM2546 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35611] It is yet further appreciated that a function of VGAM2546 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2546 include diagnosis, prevention and treatment of viral infection by Langat virus. Specific functions, and accordingly utilities, of VGAM2546 correlate with, and may be deduced from, the identity of the host target genes which VGAM2546 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35612] Nucleotide sequences of the VGAM2546 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2546 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2546 are further described hereinbelow with reference to Table 1.

[35613] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2546 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35614] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2547 (VGAM2547) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35615] VGAM2547 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2547 was detected is described hereinabove with reference to Figs. 2-8.

[35616] VGAM2547 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Langat virus. VGAM2547 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35617] VGAM2547 gene, herein designated VGAM GENE, encodes a VGAM2547 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2547 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2547 precur-

sor RNA is designated SEQ ID:2533, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2533 is located at position 6689 relative to the genome of Langat virus.

[35618] VGAM2547 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35619] An enzyme complex designated DICER COMPLEX, dices the VGAM2547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2547 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2547 RNA is designated SEQ ID:5258, and is provided hereinbelow with reference to the sequence listing part.

[35620] VGAM2547 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35621] VGAM2547 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2547 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2547 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35622] The complementary binding of VGAM2547 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2547 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2547 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35623] It is appreciated that VGAM2547 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2547 host target genes. The mRNA of

each one of this plurality of VGAM2547 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2547 RNA, herein designated VGAM RNA, and which when bound by VGAM2547 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2547 host target proteins.

[35624] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2547 gene, herein designated VGAM GENE, on one or more VGAM2547 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35625] It is yet further appreciated that a function of VGAM2547 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2547 include diagnosis, prevention and treatment of viral infection by Langat virus. Specific functions, and accordingly utilities, of VGAM2547 correlate with, and may be deduced from, the identity of the host target genes which VGAM2547 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35626] Nucleotide sequences of the VGAM2547 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2547 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2547 are further described hereinbelow with reference to Table 1.

[35627] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2547 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35628] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2548 (VGAM2548) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35629] VGAM2548 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2548 was detected is described hereinabove with reference to Figs. 2-8.

[35630] VGAM2548 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saccharomyces cerevisiae virus L-A. VGAM2548 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35631] VGAM2548 gene, herein designated VGAM GENE, encodes a VGAM2548 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2548 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2548 precursor RNA is designated SEQ ID:2534, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2534 is located at position 4007 relative to the genome of Saccharomyces cerevisiae virus L-A.

[35632] VGAM2548 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35633] An enzyme complex designated DICER COMPLEX, dices the VGAM2548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2548 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2548 RNA is designated SEQ ID:5259, and is provided hereinbelow with reference to the sequence listing part.

[35634] VGAM2548 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35635] VGAM2548 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2548 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2548 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35636] The complementary binding of VGAM2548 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2548 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2548 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35637] It is appreciated that VGAM2548 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2548 host target genes. The mRNA of each one of this plurality of VGAM2548 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2548 RNA, herein designated VGAM RNA, and which when bound by VGAM2548 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2548 host target proteins.

[35638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2548 gene, herein designated VGAM GENE, on one or more VGAM2548 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35639] It is yet further appreciated that a function of VGAM2548 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2548 include diagnosis, prevention and treatment of viral infection by Saccharomyces cerevisiae virus L-A. Specific functions, and accordingly utilities, of VGAM2548 correlate with, and may be deduced from, the identity of the host target genes which VGAM2548 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35640] Nucleotide sequences of the VGAM2548 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2548 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2548 are further described hereinbelow with reference to Table 1.

[35641] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2548 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35642] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2549 (VGAM2549) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35643] VGAM2549 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2549 was detected is described hereinabove with reference to Figs. 2-8.

[35644] VGAM2549 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saccharomyces cerevisiae virus L-A. VGAM2549 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35645] VGAM2549 gene, herein designated VGAM GENE, encodes a VGAM2549 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2549 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2549 precursor RNA is designated SEQ ID:2535, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2535 is located at position 2612 relative to the genome of Saccharomyces cerevisiae virus L-A.

[35646] VGAM2549 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35647] An enzyme complex designated DICER COMPLEX, dices the VGAM2549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2549 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2549 RNA is designated SEQ ID:5260, and is provided hereinbelow with reference to the sequence listing part.

[35648] VGAM2549 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35649] VGAM2549 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2549 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2549 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35650] The complementary binding of VGAM2549 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2549 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2549 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[35651] It is appreciated that VGAM2549 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2549 host target genes. The mRNA of each one of this plurality of VGAM2549 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2549 RNA, herein designated VGAM RNA, and which when bound by VGAM2549 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2549 host target proteins.

[35652] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2549 gene, herein designated VGAM GENE, on one or more VGAM2549 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35653] It is yet further appreciated that a function of VGAM2549 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2549 include diagnosis, prevention and treatment of viral infection by Saccharomyces cerevisiae virus L-A. Specific functions, and accordingly utilities, of VGAM2549 correlate with, and may be deduced from, the identity of the host target genes which VGAM2549 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35654] Nucleotide sequences of the VGAM2549 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2549 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2549 are further described hereinbelow with reference to Table 1.

[35655] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2549 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35656] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2550 (VGAM2550) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35657] VGAM2550 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2550 was detected is described hereinabove with reference to Figs. 2-8.

[35658] VGAM2550 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saccharomyces cerevisiae virus L-A. VGAM2550 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35659] VGAM2550 gene, herein designated VGAM GENE, encodes a VGAM2550 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2550 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2550 precursor RNA is designated SEQ ID:2536, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2536 is located at position 4405 relative to the genome of Saccharomyces cerevisiae virus L-A.

[35660] VGAM2550 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35661] An enzyme complex designated DICER COMPLEX, dices the VGAM2550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2550 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2550 RNA is designated SEQ ID:5261, and is provided hereinbelow with reference to the sequence listing part.

[35662] VGAM2550 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2550 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2550 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35663] VGAM2550 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2550 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2550 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2550 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2550 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35664] The complementary binding of VGAM2550 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2550 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2550 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2550 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35665] It is appreciated that VGAM2550 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2550 host target genes. The mRNA of each one of this plurality of VGAM2550 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2550 RNA, herein designated VGAM RNA, and which when bound by VGAM2550 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2550 host target proteins.

[35666] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2550 gene, herein designated VGAM GENE, on one or more VGAM2550 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35667] It is yet further appreciated that a function of VGAM2550 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2550 include diagnosis, prevention and treatment of viral infection by Saccharomyces cerevisiae virus L-A. Specific functions, and accordingly utilities, of VGAM2550 correlate with, and may be deduced from, the identity of the host target genes which VGAM2550 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35668] Nucleotide sequences of the VGAM2550 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2550 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2550 are further

described hereinbelow with reference to Table 1.

[35669] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2550 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35670] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2551 (VGAM2551) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35671] VGAM2551 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2551 was detected is described hereinabove with reference to Figs. 2-8.

[35672] VGAM2551 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM2551 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35673] VGAM2551 gene, herein designated VGAM GENE, encodes a VGAM2551 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2551 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2551 precursor RNA is designated SEQ ID:2537, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2537 is located at position 11536 relative to the genome of Rice yellow stunt virus.

[35674] VGAM2551 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35675] An enzyme complex designated DICER COMPLEX, dices the VGAM2551 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2551 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2551 RNA is designated SEQ ID:5262, and is provided hereinbelow with reference to the sequence listing part.

[35676] VGAM2551 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2551 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2551 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35677] VGAM2551 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2551 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2551 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2551 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2551 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35678] The complementary binding of VGAM2551 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2551 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2551

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2551 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35679] It is appreciated that VGAM2551 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2551 host target genes. The mRNA of each one of this plurality of VGAM2551 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2551 RNA, herein designated VGAM RNA, and which when bound by VGAM2551 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2551 host target proteins.

[35680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2551 gene, herein designated VGAM GENE, on one or more VGAM2551 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35681] It is yet further appreciated that a function of VGAM2551 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2551 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM2551 correlate with, and may be deduced from, the identity of the host target genes which VGAM2551 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35682] Nucleotide sequences of the VGAM2551 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2551 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2551 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2551 are further described hereinbelow with reference to Table 1.

[35683] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2551 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35684] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2552 (VGAM2552) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35685] VGAM2552 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2552 was detected is described hereinabove with reference to Figs. 2-8.

[35686] VGAM2552 gene, herein designated VGAM GENE, is a viral gene contained in the genome of rice ragged stunt virus. VGAM2552 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35687] VGAM2552 gene, herein designated VGAM GENE, encodes a VGAM2552 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2552 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2552 precur-

sor RNA is designated SEQ ID:2538, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2538 is located at position 3478 relative to the genome of rice ragged stunt virus.

[35688] VGAM2552 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35689] An enzyme complex designated DICER COMPLEX, dices the VGAM2552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2552 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide se-

quence of VGAM2552 RNA is designated SEQ ID:5263, and is provided hereinbelow with reference to the sequence listing part.

[35690] VGAM2552 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35691] VGAM2552 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2552 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2552 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35692] The complementary binding of VGAM2552 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2552 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2552 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35693] It is appreciated that VGAM2552 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2552 host target genes. The mRNA of

each one of this plurality of VGAM2552 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2552 RNA, herein designated VGAM RNA, and which when bound by VGAM2552 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2552 host target proteins.

[35694] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2552 gene, herein designated VGAM GENE, on one or more VGAM2552 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[35695] It is yet further appreciated that a function of VGAM2552 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2552 include diagnosis, prevention and treatment of viral infection by rice ragged stunt virus. Specific functions, and accordingly utilities, of VGAM2552 correlate with, and may be deduced from, the identity of the host target genes which VGAM2552 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35696] Nucleotide sequences of the VGAM2552 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2552 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2552 are further described hereinbelow with reference to Table 1.

[35697] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2552 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[35698] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2553 (VGAM2553) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35699] VGAM2553 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2553 was detected is described hereinabove with reference to Figs. 2-8.

[35700] VGAM2553 gene, herein designated VGAM GENE, is a viral gene contained in the genome of rice ragged stunt virus. VGAM2553 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35701] VGAM2553 gene, herein designated VGAM GENE, encodes a VGAM2553 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2553 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2553 precursor RNA is designated SEQ ID:2539, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2539 is located at position 271 relative to the genome of rice ragged stunt virus.

[35702] VGAM2553 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35703] An enzyme complex designated DICER COMPLEX, dices the VGAM2553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2553 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2553 RNA is designated SEQ ID:5264, and is provided hereinbelow with reference to the sequence listing part.

[35704] VGAM2553 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35705] VGAM2553 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2553 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2553 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35706] The complementary binding of VGAM2553 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2553 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2553 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35707] It is appreciated that VGAM2553 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2553 host target genes. The mRNA of each one of this plurality of VGAM2553 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2553 RNA, herein designated VGAM RNA, and which when bound by VGAM2553 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2553 host target proteins.

[35708] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2553 gene, herein designated VGAM GENE, on one or more VGAM2553 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35709] It is yet further appreciated that a function of VGAM2553 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2553 include diagnosis, prevention and treatment of viral infection by rice ragged stunt virus. Specific functions, and accordingly utilities, of VGAM2553 correlate with, and may be deduced from, the identity of the host target genes which VGAM2553 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35710] Nucleotide sequences of the VGAM2553 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2553 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2553 are further described hereinbelow with reference to Table 1.

[35711] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2553 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35712] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2554 (VGAM2554) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35713] VGAM2554 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2554 was detected is described hereinabove with reference to Figs. 2-8.

[35714] VGAM2554 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plautia stali intestine virus. VGAM2554 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35715] VGAM2554 gene, herein designated VGAM GENE, encodes a VGAM2554 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2554 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2554 precursor RNA is designated SEQ ID:2540, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2540 is located at position 685 relative to the genome of Plautia stali intestine virus.

[35716] VGAM2554 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35717] An enzyme complex designated DICER COMPLEX, dices the VGAM2554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2554 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM2554 RNA is designated SEQ ID:5265, and is provided hereinbelow with reference to the sequence listing part.

[35718] VGAM2554 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35719] VGAM2554 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2554 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2554 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35720] The complementary binding of VGAM2554 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2554 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2554 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35721] It is appreciated that VGAM2554 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2554 host target genes. The mRNA of each one of this plurality of VGAM2554 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2554 RNA, herein designated VGAM RNA, and which when bound by VGAM2554 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2554 host target proteins.

[35722] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2554 gene, herein designated VGAM GENE, on one or more VGAM2554 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35723] It is yet further appreciated that a function of VGAM2554 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2554 include diagnosis, prevention and treatment of viral infection by Plautia stali intestine virus. Specific functions, and accordingly utilities, of VGAM2554 correlate with, and may be deduced from, the identity of the host target genes which VGAM2554 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35724] Nucleotide sequences of the VGAM2554 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2554 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2554 are further described hereinbelow with reference to Table 1.

[35725] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2554 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35726] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2555 (VGAM2555) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35727] VGAM2555 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2555 was detected is described hereinabove with reference to Figs. 2-8.

[35728] VGAM2555 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plautia stali intestine virus. VGAM2555 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35729] VGAM2555 gene, herein designated VGAM GENE, encodes a VGAM2555 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2555 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2555 precursor RNA is designated SEQ ID:2541, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2541 is located at position 3272 relative to the genome of Plautia stali intestine virus.

[35730] VGAM2555 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35731] An enzyme complex designated DICER COMPLEX, dices the VGAM2555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2555 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2555 RNA is designated SEQ ID:5266, and is provided hereinbelow with reference to the sequence listing part.

[35732] VGAM2555 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35733] VGAM2555 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2555 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2555 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35734] The complementary binding of VGAM2555 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2555 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2555 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35735] It is appreciated that VGAM2555 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2555 host target genes. The mRNA of each one of this plurality of VGAM2555 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2555 RNA, herein designated VGAM RNA, and which when bound by VGAM2555 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2555 host target proteins.

[35736] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2555 gene, herein designated VGAM GENE, on one or more VGAM2555 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35737] It is yet further appreciated that a function of VGAM2555 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2555 include diagnosis, prevention and treatment of viral infection by Plautia stali intestine virus. Specific functions, and accordingly utilities, of VGAM2555 correlate with, and may be deduced from, the identity of the host target genes which VGAM2555 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35738] Nucleotide sequences of the VGAM2555 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2555 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2555 are further described hereinbelow with reference to Table 1.

[35739] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2555 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35740] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2556 (VGAM2556) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35741] VGAM2556 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2556 was detected is described hereinabove with reference to Figs. 2-8.

[35742] VGAM2556 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plautia stali intestine virus. VGAM2556 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35743] VGAM2556 gene, herein designated VGAM GENE, encodes a VGAM2556 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2556 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2556 precursor RNA is designated SEQ ID:2542, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2542 is located at position 4204 relative to the genome of Plautia stali intestine virus.

[35744] VGAM2556 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35745] An enzyme complex designated DICER COMPLEX, dices the VGAM2556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2556 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2556 RNA is designated SEQ ID:5267, and is provided hereinbelow with reference to the sequence listing part.

[35746] VGAM2556 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2556 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2556 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35747] VGAM2556 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2556 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2556 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2556 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2556 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35748] The complementary binding of VGAM2556 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2556 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2556 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2556 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[35749] It is appreciated that VGAM2556 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2556 host target genes. The mRNA of each one of this plurality of VGAM2556 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2556 RNA, herein designated VGAM RNA, and which when bound by VGAM2556 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2556 host target proteins.

[35750] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2556 gene, herein designated VGAM GENE, on one or more VGAM2556 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35751] It is yet further appreciated that a function of VGAM2556 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2556 include diagnosis, prevention and treatment of viral infection by Plautia stali intestine virus. Specific functions, and accordingly utilities, of VGAM2556 correlate with, and may be deduced from, the identity of the host target genes which VGAM2556 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35752] Nucleotide sequences of the VGAM2556 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2556 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2556 are further described hereinbelow with reference to Table 1.

[35753] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2556 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35754] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2557 (VGAM2557) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35755] VGAM2557 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2557 was detected is described hereinabove with reference to Figs. 2-8.

[35756] VGAM2557 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus. VGAM2557 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35757] VGAM2557 gene, herein designated VGAM GENE, encodes a VGAM2557 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2557 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2557 precursor RNA is designated SEQ ID:2543, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2543 is located at position 8347 relative to the genome of Himetobi P virus.

[35758] VGAM2557 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35759] An enzyme complex designated DICER COMPLEX, dices the VGAM2557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2557 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2557 RNA is designated SEQ ID:5268, and is provided hereinbelow with reference to the sequence listing part.

[35760] VGAM2557 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35761] VGAM2557 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2557 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2557 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35762] The complementary binding of VGAM2557 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2557 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2557 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35763] It is appreciated that VGAM2557 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2557 host target genes. The mRNA of each one of this plurality of VGAM2557 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2557 RNA, herein designated VGAM RNA, and which when bound by VGAM2557 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2557 host target proteins.

[35764] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2557 gene, herein designated VGAM GENE, on one or more VGAM2557 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35765] It is yet further appreciated that a function of VGAM2557 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2557 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM2557 correlate with, and may be deduced from, the identity of the host target genes which VGAM2557 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35766] Nucleotide sequences of the VGAM2557 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2557 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2557 are further described hereinbelow with reference to Table 1.

[35767] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2557 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35768] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2558 (VGAM2558) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35769] VGAM2558 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2558 was detected is described hereinabove with reference to Figs. 2-8.

[35770] VGAM2558 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus. VGAM2558 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35771] VGAM2558 gene, herein designated VGAM GENE, encodes

a VGAM2558 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2558 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2558 precursor RNA is designated SEQ ID:2544, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2544 is located at position 7354 relative to the genome of Himetobi P virus.

[35772] VGAM2558 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35773] An enzyme complex designated DICER COMPLEX, dices the VGAM2558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2558 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2558 RNA is designated SEQ ID:5269, and is provided hereinbelow with reference to the sequence listing part.

[35774] VGAM2558 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2558 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2558 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35775] VGAM2558 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2558 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2558 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2558 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2558 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35776] The complementary binding of VGAM2558 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2558 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2558 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2558 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35777] It is appreciated that VGAM2558 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2558 host target genes. The mRNA of each one of this plurality of VGAM2558 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2558 RNA, herein designated VGAM RNA, and which when bound by VGAM2558 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2558 host target proteins.

[35778] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2558 gene, herein designated VGAM GENE, on one or more VGAM2558 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35779] It is yet further appreciated that a function of VGAM2558 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2558 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM2558 correlate with, and may be deduced from, the identity of the host target genes which VGAM2558 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35780] Nucleotide sequences of the VGAM2558 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2558 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2558 are further

described hereinbelow with reference to Table 1.

[35781] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2558 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35782] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2559 (VGAM2559) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35783] VGAM2559 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2559 was detected is described hereinabove with reference to Figs. 2-8.

[35784] VGAM2559 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus. VGAM2559 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35785] VGAM2559 gene, herein designated VGAM GENE, encodes a VGAM2559 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2559 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2559 precursor RNA is designated SEQ ID:2545, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2545 is located at position 8220 relative to the genome of Himetobi P virus.

[35786] VGAM2559 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35787] An enzyme complex designated DICER COMPLEX, dices the VGAM2559 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2559 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2559 RNA is designated SEQ ID:5270, and is provided hereinbelow with reference to the sequence listing part.

[35788] VGAM2559 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2559 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2559 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35789] VGAM2559 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2559 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2559 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2559 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2559 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35790] The complementary binding of VGAM2559 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2559 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2559

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2559 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35791] It is appreciated that VGAM2559 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2559 host target genes. The mRNA of each one of this plurality of VGAM2559 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2559 RNA, herein designated VGAM RNA, and which when bound by VGAM2559 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2559 host target proteins.

[35792] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2559 gene, herein designated VGAM GENE, on one or more VGAM2559 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35793] It is yet further appreciated that a function of VGAM2559 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2559 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM2559 correlate with, and may be deduced from, the identity of the host target genes which VGAM2559 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35794] Nucleotide sequences of the VGAM2559 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2559 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2559 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2559 are further described hereinbelow with reference to Table 1.

[35795] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2559 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35796] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2560 (VGAM2560) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35797] VGAM2560 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2560 was detected is described hereinabove with reference to Figs. 2-8.

[35798] VGAM2560 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus. VGAM2560 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[35799] VGAM2560 gene, herein designated VGAM GENE, encodes a VGAM2560 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2560 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2560 precursor RNA is designated SEQ ID:2546, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2546 is located at position 8011 relative to the genome of Himetobi P virus.

[35800] VGAM2560 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35801] An enzyme complex designated DICER COMPLEX, dices

the VGAM2560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2560 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2560 RNA is designated SEQ ID:5271, and is provided hereinbelow with reference to the sequence listing part.

[35802] VGAM2560 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2560 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2560 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35803] VGAM2560 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2560 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2560 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2560 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2560 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35804] The complementary binding of VGAM2560 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2560 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2560 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2560 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35805] It is appreciated that VGAM2560 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2560 host target genes. The mRNA of each one of this plurality of VGAM2560 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2560 RNA, herein designated VGAM RNA, and which when bound by VGAM2560 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2560 host target proteins.

[35806] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2560 gene, herein designated VGAM GENE, on one or more VGAM2560 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35807] It is yet further appreciated that a function of VGAM2560 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2560 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM2560 correlate with, and may be deduced from, the identity of the host target genes which VGAM2560 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35808] Nucleotide sequences of the VGAM2560 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2560 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2560 are further described hereinbelow with reference to Table 1.

[35809] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2560 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35810] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2561 (VGAM2561) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35811] VGAM2561 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2561 was detected is described hereinabove with reference to Figs. 2-8.

[35812] VGAM2561 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus. VGAM2561 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[35813] VGAM2561 gene, herein designated VGAM GENE, encodes a VGAM2561 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2561 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2561 precursor RNA is designated SEQ ID:2547, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2547 is located at position 8473 relative to the genome of Himetobi P virus.

[35814] VGAM2561 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35815] An enzyme complex designated DICER COMPLEX, dices the VGAM2561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2561 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2561 RNA is designated SEQ ID:5272, and is provided hereinbelow with reference to the sequence listing part.

[35816] VGAM2561 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2561 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2561 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35817] VGAM2561 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2561 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2561 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2561 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2561 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35818] The complementary binding of VGAM2561 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2561 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2561 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2561 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35819] It is appreciated that VGAM2561 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2561 host target genes. The mRNA of each one of this plurality of VGAM2561 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2561 RNA, herein designated VGAM RNA, and which when bound by VGAM2561 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2561 host target proteins.

[35820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2561 gene, herein designated VGAM GENE, on one or more VGAM2561 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35821] It is yet further appreciated that a function of VGAM2561 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2561 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM2561 correlate with, and may be deduced from, the identity of the host target genes which VGAM2561 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35822] Nucleotide sequences of the VGAM2561 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2561 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2561 are further described hereinbelow with reference to Table 1.

[35823] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2561 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35824] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2562 (VGAM2562) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35825] VGAM2562 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2562 was detected is described hereinabove with reference to Figs. 2-8.

[35826] VGAM2562 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus.

VGAM2562 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35827] VGAM2562 gene, herein designated VGAM GENE, encodes a VGAM2562 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2562 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2562 precursor RNA is designated SEQ ID:2548, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2548 is located at position 7594 relative to the genome of Himetobi P virus.

[35828] VGAM2562 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[35829] An enzyme complex designated DICER COMPLEX, dices the VGAM2562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2562 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2562 RNA is designated SEQ ID:5273, and is provided hereinbelow with reference to the sequence listing part.

[35830] VGAM2562 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35831] VGAM2562 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2562 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2562 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35832] The complementary binding of VGAM2562 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2562 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2562 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35833] It is appreciated that VGAM2562 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2562 host target genes. The mRNA of each one of this plurality of VGAM2562 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2562 RNA, herein designated VGAM RNA, and which when bound by VGAM2562 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2562 host target proteins.

[35834] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2562 gene, herein designated VGAM GENE, on one or more VGAM2562 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35835] It is yet further appreciated that a function of VGAM2562 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2562 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM2562 correlate with, and may be deduced from, the identity of the host target genes which VGAM2562 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35836] Nucleotide sequences of the VGAM2562 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2562 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2562 are further described hereinbelow with reference to Table 1.

[35837] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2562 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35838] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2563 (VGAM2563) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35839] VGAM2563 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2563 was detected is described hereinabove with reference to Figs. 2-8.

[35840] VGAM2563 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Himetobi P virus. VGAM2563 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35841] VGAM2563 gene, herein designated VGAM GENE, encodes a VGAM2563 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2563 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2563 precursor RNA is designated SEQ ID:2549, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2549 is located at position 8878 relative to the genome of Himetobi P virus.

[35842] VGAM2563 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35843] An enzyme complex designated DICER COMPLEX, dices the VGAM2563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2563 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2563 RNA is designated SEQ ID:5274, and is provided hereinbelow with reference to the sequence listing part.

[35844] VGAM2563 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35845] VGAM2563 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2563 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2563 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35846] The complementary binding of VGAM2563 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2563 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2563 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35847] It is appreciated that VGAM2563 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2563 host target genes. The mRNA of each one of this plurality of VGAM2563 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2563 RNA, herein designated VGAM RNA, and which when bound by VGAM2563 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2563 host target proteins.

[35848] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2563 gene, herein designated VGAM GENE, on one or more VGAM2563 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35849] It is yet further appreciated that a function of VGAM2563 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2563 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM2563 correlate with, and may be deduced from, the identity of the host target genes which VGAM2563 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35850] Nucleotide sequences of the VGAM2563 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2563 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2563 are further described hereinbelow with reference to Table 1.

[35851] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2563 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35852] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2564 (VGAM2564) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35853] VGAM2564 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2564 was detected is described hereinabove with reference to Figs. 2-8.

[35854] VGAM2564 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2564 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35855] VGAM2564 gene, herein designated VGAM GENE, encodes a VGAM2564 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2564 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2564 precursor RNA is designated SEQ ID:2550, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2550 is located at position 3567 relative to the genome of Triatoma virus.

[35856] VGAM2564 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35857] An enzyme complex designated DICER COMPLEX, dices the VGAM2564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2564 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2564 RNA is designated SEQ ID:5275, and is provided hereinbelow with reference to the sequence listing part.

[35858] VGAM2564 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[35859] VGAM2564 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2564 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2564 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35860] The complementary binding of VGAM2564 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2564 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2564 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35861] It is appreciated that VGAM2564 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2564 host target genes. The mRNA of each one of this plurality of VGAM2564 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2564 RNA, herein designated VGAM RNA, and which when bound by VGAM2564 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2564 host target proteins.

[35862] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2564 gene, herein designated VGAM GENE, on one

or more VGAM2564 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35863] It is yet further appreciated that a function of VGAM2564 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2564 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2564 correlate with, and may be deduced from, the identity of the host target genes which VGAM2564 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35864] Nucleotide sequences of the VGAM2564 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2564 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2564 are further described hereinbelow with reference to Table 1.

[35865] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2564 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35866] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2565 (VGAM2565) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35867] VGAM2565 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2565 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[35868] VGAM2565 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2565 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35869] VGAM2565 gene, herein designated VGAM GENE, encodes a VGAM2565 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2565 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2565 precursor RNA is designated SEQ ID:2551, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2551 is located at position 1775 relative to the genome of Triatoma virus.

[35870] VGAM2565 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35871] An enzyme complex designated DICER COMPLEX, dices the VGAM2565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2565 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2565 RNA is designated SEQ ID:5276, and is provided hereinbelow with reference to the sequence listing part.

[35872] VGAM2565 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35873] VGAM2565 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2565 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2565 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[35874] The complementary binding of VGAM2565 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2565 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2565 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35875] It is appreciated that VGAM2565 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2565 host target genes. The mRNA of each one of this plurality of VGAM2565 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2565 RNA, herein designated VGAM RNA, and which when bound by VGAM2565 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2565 host target proteins.

[35876] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2565 gene, herein designated VGAM GENE, on one or more VGAM2565 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35877] It is yet further appreciated that a function of VGAM2565 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2565 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2565 correlate with, and may be deduced from, the identity of the host target genes which VGAM2565 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[35878] Nucleotide sequences of the VGAM2565 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2565 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2565 are further described hereinbelow with reference to Table 1.

[35879] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2565 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35880] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2566 (VGAM2566) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35881] VGAM2566 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2566 was detected is described hereinabove with reference to Figs. 2-8.

[35882] VGAM2566 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2566 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35883] VGAM2566 gene, herein designated VGAM GENE, encodes a VGAM2566 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2566 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2566 precursor RNA is designated SEQ ID:2552, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2552 is located at position 2022 relative to the genome of Triatoma virus.

[35884] VGAM2566 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35885] An enzyme complex designated DICER COMPLEX, dices the VGAM2566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2566 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2566 RNA is designated SEQ ID:5277, and is provided hereinbelow with reference to the sequence listing part.

[35886] VGAM2566 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35887] VGAM2566 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2566 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2566 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35888] The complementary binding of VGAM2566 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2566 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2566 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35889] It is appreciated that VGAM2566 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2566 host target genes. The mRNA of each one of this plurality of VGAM2566 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2566 RNA, herein designated VGAM RNA, and which when bound by VGAM2566 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2566 host target proteins.

[35890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2566 gene, herein designated VGAM GENE, on one or more VGAM2566 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35891] It is yet further appreciated that a function of VGAM2566 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2566 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2566 correlate with, and may be deduced from, the identity of the host target genes which VGAM2566 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[35892] Nucleotide sequences of the VGAM2566 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2566 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2566 are further described hereinbelow with reference to Table 1.

[35893] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2566 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35894] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2567 (VGAM2567) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35895] VGAM2567 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2567 was detected is described hereinabove with reference to Figs. 2-8.

[35896] VGAM2567 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2567 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35897] VGAM2567 gene, herein designated VGAM GENE, encodes a VGAM2567 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2567 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2567 precursor RNA is designated SEQ ID:2553, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2553 is located at position 3811 relative to the genome of Triatoma virus.

[35898] VGAM2567 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35899] An enzyme complex designated DICER COMPLEX, dices the VGAM2567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2567 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2567 RNA is designated SEQ ID:5278, and is provided hereinbelow with reference to the sequence listing part.

[35900] VGAM2567 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2567 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2567 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35901] VGAM2567 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2567 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2567 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2567 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2567 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35902] The complementary binding of VGAM2567 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2567 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2567 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2567 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35903] It is appreciated that VGAM2567 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2567 host target genes. The mRNA of each one of this plurality of VGAM2567 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2567 RNA, herein designated VGAM RNA, and which when bound by VGAM2567 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2567 host target proteins.

[35904] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2567 gene, herein designated VGAM GENE, on one or more VGAM2567 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35905] It is yet further appreciated that a function of VGAM2567 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2567 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2567 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2567 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35906] Nucleotide sequences of the VGAM2567 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2567 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2567 are further described hereinbelow with reference to Table 1.

[35907] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2567 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35908] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2568 (VGAM2568) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35909] VGAM2568 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2568 was detected is described hereinabove with reference to Figs. 2-8.

[35910] VGAM2568 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2568 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35911] VGAM2568 gene, herein designated VGAM GENE, encodes a VGAM2568 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2568 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2568 precursor RNA is designated SEQ ID:2554, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2554 is located at position 4293 relative to the genome of Triatoma virus.

[35912] VGAM2568 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2568 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35913] An enzyme complex designated DICER COMPLEX, dices the VGAM2568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2568 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2568 RNA is designated SEQ ID:5279, and is provided hereinbelow with reference to the sequence listing part.

[35914] VGAM2568 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2568 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2568 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35915] VGAM2568 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2568 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2568 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2568 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2568 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35916] The complementary binding of VGAM2568 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2568 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2568 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2568 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35917] It is appreciated that VGAM2568 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2568 host target genes. The mRNA of each one of this plurality of VGAM2568 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2568 RNA, herein designated VGAM RNA, and which when bound by VGAM2568 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2568 host target proteins.

[35918] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2568 gene, herein designated VGAM GENE, on one or more VGAM2568 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35919] It is yet further appreciated that a function of VGAM2568 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2568 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2568 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2568 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35920] Nucleotide sequences of the VGAM2568 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2568 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2568 are further described hereinbelow with reference to Table 1.

[35921] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2568 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35922] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2569 (VGAM2569) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[35923] VGAM2569 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2569 was detected is described hereinabove with reference to Figs. 2-8.

[35924] VGAM2569 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2569 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35925] VGAM2569 gene, herein designated VGAM GENE, encodes a VGAM2569 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2569 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2569 precursor RNA is designated SEQ ID:2555, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2555 is located at position 5389 relative to the genome of Triatoma virus.

[35926] VGAM2569 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2569 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35927] An enzyme complex designated DICER COMPLEX, dices the VGAM2569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2569 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2569 RNA is designated SEQ ID:5280, and is provided hereinbelow with reference to the sequence listing part.

[35928] VGAM2569 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2569 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2569 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35929] VGAM2569 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2569 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2569 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2569 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2569 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35930] The complementary binding of VGAM2569 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2569 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2569 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2569 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35931] It is appreciated that VGAM2569 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2569 host target genes. The mRNA of each one of this plurality of VGAM2569 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2569 RNA, herein designated VGAM RNA, and which when bound by VGAM2569 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2569 host target proteins.

[35932] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2569 gene, herein designated VGAM GENE, on one or more VGAM2569 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35933] It is yet further appreciated that a function of VGAM2569 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2569 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific

functions, and accordingly utilities, of VGAM2569 correlate with, and may be deduced from, the identity of the host target genes which VGAM2569 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35934] Nucleotide sequences of the VGAM2569 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2569 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2569 are further described hereinbelow with reference to Table 1.

[35935] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2569 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35936] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2570 (VGAM2570) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[35937] VGAM2570 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2570 was detected is described hereinabove with reference to Figs. 2-8.

[35938] VGAM2570 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2570 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35939] VGAM2570 gene, herein designated VGAM GENE, encodes a VGAM2570 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2570 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2570 precursor RNA is designated SEQ ID:2556, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2556 is located at position 5274 relative to the genome of Triatoma virus.

[35940] VGAM2570 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35941] An enzyme complex designated DICER COMPLEX, dices the VGAM2570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2570 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM2570 RNA is designated SEQ ID:5281, and is provided hereinbelow with reference to the sequence listing part.

[35942] VGAM2570 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2570 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2570 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35943] VGAM2570 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2570 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2570 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2570 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2570 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35944] The complementary binding of VGAM2570 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2570 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2570 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2570 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35945] It is appreciated that VGAM2570 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2570 host target genes. The mRNA of each one of this plurality of VGAM2570 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2570 RNA, herein designated VGAM RNA, and which when bound by VGAM2570 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2570 host target proteins.

[35946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2570 gene, herein designated VGAM GENE, on one or more VGAM2570 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35947] It is yet further appreciated that a function of VGAM2570 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2570 include diagnosis, prevention and

treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2570 correlate with, and may be deduced from, the identity of the host target genes which VGAM2570 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35948] Nucleotide sequences of the VGAM2570 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2570 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2570 are further described hereinbelow with reference to Table 1.

[35949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2570 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35950] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2571 (VGAM2571) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35951] VGAM2571 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2571 was detected is described hereinabove with reference to Figs. 2-8.

[35952] VGAM2571 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2571 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35953] VGAM2571 gene, herein designated VGAM GENE, encodes a VGAM2571 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2571 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2571 precursor RNA is designated SEQ ID:2557, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2557 is located at position 5836 relative to the genome of Triatoma virus.

[35954] VGAM2571 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35955] An enzyme complex designated DICER COMPLEX, dices the VGAM2571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2571 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2571 RNA is designated SEQ ID:5282, and is provided hereinbelow with reference to the sequence listing part.

[35956] VGAM2571 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35957] VGAM2571 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2571 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2571 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35958] The complementary binding of VGAM2571 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2571 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2571 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35959] It is appreciated that VGAM2571 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2571 host target genes. The mRNA of each one of this plurality of VGAM2571 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2571 RNA, herein designated VGAM

RNA, and which when bound by VGAM2571 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2571 host target proteins.

[35960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2571 gene, herein designated VGAM GENE, on one or more VGAM2571 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35961] It is yet further appreciated that a function of VGAM2571 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2571 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2571 correlate with, and may be deduced from, the identity of the host target genes which VGAM2571 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35962] Nucleotide sequences of the VGAM2571 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2571 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2571 are further described hereinbelow with reference to Table 1.

[35963] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2571 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35964] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2572 (VGAM2572) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35965] VGAM2572 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2572 was detected is described hereinabove with reference to Figs. 2-8.

[35966] VGAM2572 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2572 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35967] VGAM2572 gene, herein designated VGAM GENE, encodes a VGAM2572 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2572 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2572 precursor RNA is designated SEQ ID:2558, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2558 is located at position 3076

relative to the genome of Triatoma virus.

[35968] VGAM2572 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35969] An enzyme complex designated DICER COMPLEX, dices the VGAM2572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2572 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2572 RNA is designated SEQ ID:5283, and is provided hereinbelow with reference to the sequence listing part.

[35970] VGAM2572 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35971] VGAM2572 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2572 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2572 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35972] The complementary binding of VGAM2572 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2572 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2572 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35973] It is appreciated that VGAM2572 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2572 host target genes. The mRNA of each one of this plurality of VGAM2572 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2572 RNA, herein designated VGAM RNA, and which when bound by VGAM2572 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2572 host target proteins.

[35974] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2572 gene, herein designated VGAM GENE, on one or more VGAM2572 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35975] It is yet further appreciated that a function of VGAM2572 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2572 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2572 correlate with, and may be deduced from, the identity of the host target genes which VGAM2572 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35976] Nucleotide sequences of the VGAM2572 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2572 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2572 are further described hereinbelow with reference to Table 1.

[35977] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2572 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35978] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2573 (VGAM2573) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35979] VGAM2573 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2573 was detected is described hereinabove with reference to Figs. 2-8.

[35980] VGAM2573 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2573 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35981] VGAM2573 gene, herein designated VGAM GENE, encodes a VGAM2573 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2573 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2573 precursor RNA is designated SEQ ID:2559, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2559 is located at position 3368 relative to the genome of Triatoma virus.

[35982] VGAM2573 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35983] An enzyme complex designated DICER COMPLEX, dices the VGAM2573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2573 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2573 RNA is designated SEQ ID:5284, and is provided hereinbelow with reference to the sequence

listing part.

[35984] VGAM2573 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35985] VGAM2573 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2573 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2573 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35986] The complementary binding of VGAM2573 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2573 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2573 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35987] It is appreciated that VGAM2573 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2573 host target genes. The mRNA of each one of this plurality of VGAM2573 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2573 RNA, herein designated VGAM RNA, and which when bound by VGAM2573 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2573 host target proteins.

[35988] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2573 gene, herein designated VGAM GENE, on one or more VGAM2573 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35989] It is yet further appreciated that a function of VGAM2573

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2573 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2573 correlate with, and may be deduced from, the identity of the host target genes which VGAM2573 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35990] Nucleotide sequences of the VGAM2573 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2573 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2573 are further described hereinbelow with reference to Table 1.

[35991] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2573 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35992] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2574 (VGAM2574) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35993] VGAM2574 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2574 was detected is described hereinabove with reference to Figs. 2-8.

[35994] VGAM2574 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2574 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35995] VGAM2574 gene, herein designated VGAM GENE, encodes a VGAM2574 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2574 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2574 precursor RNA is designated SEQ ID:2560, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2560 is located at position 2215 relative to the genome of Triatoma virus.

[35996] VGAM2574 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35997] An enzyme complex designated DICER COMPLEX, dices the VGAM2574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2574 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2574 RNA is designated SEQ ID:5285, and

is provided hereinbelow with reference to the sequence listing part.

[35998] VGAM2574 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35999] VGAM2574 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2574 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2574 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36000] The complementary binding of VGAM2574 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2574 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2574 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36001] It is appreciated that VGAM2574 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2574 host target genes. The mRNA of each one of this plurality of VGAM2574 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2574 RNA, herein designated VGAM RNA, and which when bound by VGAM2574 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2574 host target proteins.

[36002] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2574 gene, herein designated VGAM GENE, on one or more VGAM2574 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36003] It is yet further appreciated that a function of VGAM2574 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2574 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2574 correlate with, and may be deduced from, the identity of the host target genes which VGAM2574 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36004] Nucleotide sequences of the VGAM2574 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2574 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2574 are further described hereinbelow with reference to Table 1.

[36005] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2574 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36006] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2575 (VGAM2575) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36007] VGAM2575 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2575 was detected is described hereinabove with reference to Figs. 2-8.

[36008] VGAM2575 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2575 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36009] VGAM2575 gene, herein designated VGAM GENE, encodes a VGAM2575 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2575 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2575 precur-

sor RNA is designated SEQ ID:2561, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2561 is located at position 4661 relative to the genome of Triatoma virus.

[36010] VGAM2575 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36011] An enzyme complex designated DICER COMPLEX, dices the VGAM2575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2575 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide se-

quence of VGAM2575 RNA is designated SEQ ID:5286, and is provided hereinbelow with reference to the sequence listing part.

[36012] VGAM2575 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2575 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2575 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36013] VGAM2575 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2575 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2575 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2575 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2575 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36014] The complementary binding of VGAM2575 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2575 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2575 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2575 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36015] It is appreciated that VGAM2575 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2575 host target genes. The mRNA of

each one of this plurality of VGAM2575 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2575 RNA, herein designated VGAM RNA, and which when bound by VGAM2575 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2575 host target proteins.

[36016] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2575 gene, herein designated VGAM GENE, on one or more VGAM2575 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[36017] It is yet further appreciated that a function of VGAM2575 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2575 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2575 correlate with, and may be deduced from, the identity of the host target genes which VGAM2575 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36018] Nucleotide sequences of the VGAM2575 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2575 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2575 are further described hereinbelow with reference to Table 1.

[36019] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2575 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[36020] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2576 (VGAM2576) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36021] VGAM2576 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2576 was detected is described hereinabove with reference to Figs. 2-8.

[36022] VGAM2576 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2576 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36023] VGAM2576 gene, herein designated VGAM GENE, encodes a VGAM2576 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2576 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2576 precursor RNA is designated SEQ ID:2562, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2562 is located at position 5068 relative to the genome of Triatoma virus.

[36024] VGAM2576 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36025] An enzyme complex designated DICER COMPLEX, dices the VGAM2576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2576 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 90%) nucleotide sequence of VGAM2576 RNA is designated SEQ ID:5287, and is provided hereinbelow with reference to the sequence listing part.

[36026] VGAM2576 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36027] VGAM2576 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2576 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2576 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36028] The complementary binding of VGAM2576 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2576 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2576 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36029] It is appreciated that VGAM2576 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2576 host target genes. The mRNA of each one of this plurality of VGAM2576 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2576 RNA, herein designated VGAM RNA, and which when bound by VGAM2576 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2576 host target proteins.

[36030] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2576 gene, herein designated VGAM GENE, on one or more VGAM2576 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36031] It is yet further appreciated that a function of VGAM2576 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2576 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2576 correlate with, and may be deduced from, the identity of the host target genes which VGAM2576 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36032] Nucleotide sequences of the VGAM2576 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2576 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2576 are further described hereinbelow with reference to Table 1.

[36033] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2576 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36034] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2577 (VGAM2577) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36035] VGAM2577 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2577 was detected is described hereinabove with reference to Figs. 2-8.

[36036] VGAM2577 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2577 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36037] VGAM2577 gene, herein designated VGAM GENE, encodes a VGAM2577 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2577 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2577 precursor RNA is designated SEQ ID:2563, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2563 is located at position 985 relative to the genome of Triatoma virus.

[36038] VGAM2577 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36039] An enzyme complex designated DICER COMPLEX, dices the VGAM2577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2577 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM2577 RNA is designated SEQ ID:5288, and is provided hereinbelow with reference to the sequence listing part.

[36040] VGAM2577 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2577 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2577 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36041] VGAM2577 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2577 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2577 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2577 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2577 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36042] The complementary binding of VGAM2577 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2577 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2577 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2577 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36043] It is appreciated that VGAM2577 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2577 host target genes. The mRNA of each one of this plurality of VGAM2577 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2577 RNA, herein designated VGAM RNA, and which when bound by VGAM2577 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2577 host target proteins.

[36044] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2577 gene, herein designated VGAM GENE, on one or more VGAM2577 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36045] It is yet further appreciated that a function of VGAM2577 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2577 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2577 correlate with, and may be deduced from, the identity of the host target genes which VGAM2577 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36046] Nucleotide sequences of the VGAM2577 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2577 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2577 are further described hereinbelow with reference to Table 1.

[36047] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2577 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36048] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2578 (VGAM2578) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36049] VGAM2578 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2578 was detected is described hereinabove with reference to Figs. 2-8.

[36050] VGAM2578 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2578 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36051] VGAM2578 gene, herein designated VGAM GENE, encodes a VGAM2578 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2578 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2578 precursor RNA is designated SEQ ID:2564, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2564 is located at position 849 relative to the genome of Triatoma virus.

[36052] VGAM2578 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36053] An enzyme complex designated DICER COMPLEX, dices the VGAM2578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2578 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2578 RNA is designated SEQ ID:5289, and is provided hereinbelow with reference to the sequence listing part.

[36054] VGAM2578 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36055] VGAM2578 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2578 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2578 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36056] The complementary binding of VGAM2578 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2578 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2578 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36057] It is appreciated that VGAM2578 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2578 host target genes. The mRNA of each one of this plurality of VGAM2578 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2578 RNA, herein designated VGAM RNA, and which when bound by VGAM2578 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2578 host target proteins.

[36058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2578 gene, herein designated VGAM GENE, on one or more VGAM2578 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36059] It is yet further appreciated that a function of VGAM2578 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2578 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM2578 correlate with, and may be deduced from, the identity of the host target genes which VGAM2578 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36060] Nucleotide sequences of the VGAM2578 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2578 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2578 are further described hereinbelow with reference to Table 1.

[36061] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2578 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36062] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2579 (VGAM2579) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36063] VGAM2579 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2579 was detected is described hereinabove with reference to Figs. 2-8.

[36064] VGAM2579 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM2579 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36065] VGAM2579 gene, herein designated VGAM GENE, encodes a VGAM2579 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-
